I have all the Antic and STart issues w/ Antic, and thought about doing this myself. Unfortunately, My friend with a nice flatbed scanner is off to CA visiting a girl he met on IRC. <g> I will be glad to help when he returns. I had thought about digitizing every page until I found out how long that would take, and also how much free HD space I have compared to how much this would take. Also, I need some very good OCR software to come into my possesion, one that does fonts, text placement, line drawing, etc etc.. The package included with his scanner needed alot of help when we tried to ocr the table of contents page of one antic mag.

I would love to see a digital version of every Antic mag online, and catalogued to boot! Both text versions and the actual digitized page, large enough to be readable of course. Any other suggestions? (so far we are dreaming unless someone can donate server space(digitized pages of info get large fast.)

Rick

 Reread the first part of the thread, we got server space covered
already...oops.... :)

What image dimensions do you want for the covers and ads? also, if we
were to digitize every page for _reading_, what image dimensions do we
want? All my mags are almost pristine in condition, provided enough
time I could put them all online, but are there other altruistic
individuals with both a scanner and a large collection of Antics (and
Analog!)?

Anyone know of a program that takes a digitized magazine page and
automatically html-izes it? Now that would be cool.

The site looks really good. I have every issue of Antic & Analog and
access to a color scanner. I'll see what I can do about helping you
out. This is a very good idea!

Great - well, anyone with any or all of: some issues, a scanner, or
knowledge of HTML is invited to help. :)

I will be doing that. Unfortunatly, the Antic disks didn't start until
1984, but the magazine started in 1982. So there are about 18 issues of
diskless code. :(

The information is available in the "About" section of the Web site.

Hey! What happened to this newsgroup? Last time I looked at this (which
was about a year ago) there were lots of articles on lots of things, and I liked
reading some of the stuff on here. Now it appears that nobody likes to post
messages here anymore! So, if anyone can tell me what happened, I sure
would be grateful.

>If it came with a complete, guaranteed to work MiNT package that would
>be different.

XaAES is still very much beta, so I don't very many people to get it
working. I have had a lot of trouble getting oAESis to work myself (it
varies from release to release though).

>> There are Beta Versions of several free AES Clones as well: XaAES and
>> oAESis. Both of them are definately faster than Multitos (that does not
>> seem to be too difficult) and at least XaAES runs AFAIK with Memory
>> Protection.

Actually, XaAES still (even on my personal version, not yet released)
has problems with memory protection that I've not managed to sort out
yet :(

>I did get the MINT030 binaries, and strangely enough, that works
>reasonably well and is fairly stable. I need to study up and figure out
>how to adjust the niceness properly (ALERT.ACC was burning 25% of my CPU

Use the PS_CPX in the Xcontrol panel. XaAES, oAESis and AES4.1 all
support launching apps with pre-set priorities (XaAES and oAESis go a
little further with their multi-process / multi-user support as well).

Craig.

Not really, but with a scanner and OCR software, one could import text
into word/wordperfect: it shouldn't be that hard to convert...

A quick and easy way to add plain text in columns is to use the <pre> tag
(indicating preformatted text). Use the <H> tags for headlines, and
inline graphics, and the pages can look just like the original pages
without much storage overhead.

It's not true, if you know how to treat the optimizer.

>Compilation options can be the biggie.

Yes, and those aren't really very well explained in the Lattice C docs.

In the optimization dialog, only three of the options should be selected
to produce well optimized code. One of the four must be deselected (the
second IIRC) or things fall apart.
How's that for confusing?

Apart from that, the optimizer is very buggy.
Not that it produces incorrect code, but it fails to optimize for
incredibly strange reasons. It can actually produce worse code than you
get by turning it off completely!

I emailed HiSoft about the problems several years ago (before 5.60), but
they never did anything about it.

The most important thing to remember is that the optimizer _hates_
16 bit integers. Most optimization seems to be simply turned off when
those appears.

>But you can also run the app through the supplied optimiser (an optional
>phase in the compile process) to speed it up by 10% (I believe that the
>manual gives that figure - I have never actually got that much of a
>speedup from it)

The optimizer can give _very_ large speedups, like more than ten times. Depending on what kind of code you write, you may also have next to no speedup. And then there are the bugs I mentioned above...

On a real program (MGIF) I've gotten about five times speedup or so over the unoptimized version for some functions.

By the way, someone wondered what MGIF was. I suggest you take a look at my WWW page. See the .sig at the end.

>But even then it isn't the fastest.

Actually, it's the best I've found for some things, even beating GCC. TurboC/PureC is a joke in comparison.

It would be interesting to hear what other compilers do about the following short program I threw together yesterday:
(Please, note that the program is not supposed to do anything useful. It's just a test of optimization performance).

```
#define ROWS 25
#define COLS 25

void main(void)
{
        long i, j, k;
        long array[ROWS][COLS];

        for(i = 0; i < ROWS * COLS; i++)
                *((long *)array + i) = 0;

        k = COLS * ROWS;
        for(i = 0; i < ROWS; i++)
                for(j = 0; j < COLS; j++)
                        array[i][j] += i * k;
}
```

I will post my results from Lattice C, PureC and GCC soon (like tomorrow).

>The enclosed debugger, MON is good, but will not co-operate in MultiTOS.

How about that third part source level debugger (I forgot it's name)? I've never tried it myself, since I use GCC about 99% of the time, but wasn't it even FreeWare?

>Lattice is still better than Megamax C, although not as fast as Laser C
>(both in compilation and code produced). But it beats Laser in being able

I would be _extremely_ surprised if Laser C produced anywhere near the same quality of code as Lattice C on the program above.
If those bugs hadn't prevented the optimization from working most of the time it would have been a much more popular compiler.

TurboC/PureC are _very_ fast at compiling, but do next to no optimization at all. They're rather good at register allocation, however, which means that on simple code they can often seem to be very good optimizers. The register passing of function arguments also helps a lot.

As you'll see when I post the code generated from the program above (or if you try it yourselves), which may seem simple, TurboC/PureC are actually quite pathetic.

I would love to help out on this project. I would be willing to HTML-ize text (as long as it can be scanned in and converted to text with some OCR previously). I think that articles should be done in HTML format, with illustrations as scanned-in pictures. I could even crop images to place in illustrations. Too bad I don't have convenient access to a flatbed color scanner. :(However, I have most Antic and Analog magazines.

This is a really good idea! Way to go!

-=* NEW ATARI WEB PAGE *=-

I've built a web page, due to my boredom :) If you'd like to see
what's come out of it, check it out!

http://www.ior.com/~danbrown/

It should be friendly to all browsers (lynx, CAB, and Netscape)

It contains a good listing of Atari Companies, Music, and more!
It is still under construction, so is being updated almost daily!

I'd like to try doing this myself. Mind giving me a sequence of steps on
what to use and where to do it to do this? Doing this command, the ls > z
would be to send a listing of the files to a file.

: >Do you have the unassembled code lying around? I'd like to see it.

:
: I'm afraid not, ls is wired into the MWC command shell. I'm sure you
: could get a good idea of its functions by looking at unix source.

I've seen some Unix sources, but guess it's time for me to look into it some more. I'm about to install MiNT and GCC onto a 1.6 gig drive, as well as MWC, to do a bit of switching between the two. Since the 0.95 install of MiNT is on the Atari Compendium CD I picked up on when i was at the MIST AtariFest, I'll install it from there, then do installs on the subsequent installs til I get to 1.41 and patchlevel 46.

: >I keep forgetting... What does MSH stand for again?
:
: MicroSHell.

That's right... I was reading my manual, and realized it meant that. Still am a bit of distance from finishing up reading it.

Reminds me, I'm about to write a program of my own that does Top 10s of various places of the Transcendence BBS. Top 10 of posters, calls, uploads, downloads, as well as Bottom Ten. I'm going to be using the qsort command, and am wondering about sorting an array, without sorting just one column... I was considering a struct arrayname with several parts to it, namely, username, posts, calls, uploads, and downloads. I'll read the index file, counting the users already on, then make a subroutine to read them in, putting them into the array, and then sort.

: MagiC does not suffer from the 40 folder bug. One thing I forgot to
: mention is that the shell gets as far as creating the redirected file.
: As it is zero length then the shell obviously packed up before it got
: to issuing an Fclose().

It doesn't? Most interesting. I gotta get it sometime. So the shell just 'forgets' to close the file after creating it? Apparently there's no error checking if I'm understanding you right.

: Here's a section showing how I added some newer Gem functions. Boring,
: but perfectly possible. It could be simplified further with the MWC
: library code sources because crystal() could be used I guess.

Read it, but it looks more like assembler to me. I'm considering trying 68K after I learn it some more. I never really got into 6502 assembler when I was playing with my 8bit. However, if I wish to get a little more complex, I'll use GCC and its updated command listings.

: gemdos, bios and xbios functions are trivial - simply define a macro
: in the same manner as the relevent header file.

The compiler creates the headers for you, though all you need to do is write the actual coding yourself, according to the stuff I've been going through. There are some header files that you don't write, that I've seen that merely help out in writing your program. There's a QBBS.H file in the LazyBBS source code I've read through that's in the umich archives, that

seems to be a QBBS style message base setup, though you have to be the one to write the actual message base. Shall I post this file?

: I saw it. Good luck!

Thank you. Now all I need to is find Bob Swartz, owner and president, if I'm understanding right, of Coherent and Mark Williams Company. I suspect he's in the Northbrook, IL area, about 30 minutes outside Chicago, and he could be in Chicago somewhere. So far, I've found no email address, neither have I found a snailmailing address, though I found an email address of coherent@vma.cc.nd.edu. I emailed that, but no response yet. I did a telnet to the smtp port at nd.edu, and did a vrfy of it. Came back with something that looked like a mailhost at irishvma, whatever that is. If you do a whois on mwc.com, it'll tell you who it is. Below is what I've gotten so far...

    Yeh, this moves it, but where does it save it??
Just what are ESCj and ESCk (C_SAVE and C_RESTORE)???
I thought they were supposed to save the present cursor location,
and move it back when done.
    But that doesn't seem to do it for me.

Don't do it!
<pre> is great for some things, but here we DON'T CARE about the
original layout, we care about the information itself. If you try to
do multiple columns, it will just make it harder to read -- and
convert to other forms.

We're using OCR to make text versions of the pages. Covers and necessary images are being scanned as JPEGs.

We won't be doing graphical scans of all the pages: its a TREMENDOUS waste of disk space (5K for the text of an average article, vs. about 1MB for the "actual digitized pages.") Its the INFORMATION that is important and useful, not the layout. And the information is much more useful and searchable as HTML.

OK, I tried RTFMing on this, but I couldn't find anything. When I'm using SozobonX to do my C programming assignments, I occassionally get memory violations (type: free) when ld is run by cc. The weird thing is, it's usually caused by adding one puts() or printf() statement; when I comment out the statement, everything is compiled and linked just fine. I suspect that ld may not be allocating enough memory for itself, and there's a switch (-B <n>) to fix this. But how do I pass ld a switch from the makefile? I tried running ls by itself on my .o files, and it was unable to find such symbols as __argc and __argv (and others, which I can't recall ATM). In what library are these symbols?

ESC j and ESC k are used internally when emulating some other ESC sequences which makes them pretty useless.

Hello everyone.
I seem to remember seeing an ST assembler printing routine that was supposed to work far faster than the TOS effort. Can anyone got a copy or can you direct me to it?

I've looked at the TOS BIOS listing of the routine that adresses the centronics port and there are 2 aspects that really puzzle me. Why is it that:-

* there are so many successive operations putting the machine into supervisor mode, (surely one should be enough, followed at the end of the business by the restoration of user mode).
* supposing that it *is* necessary to put the machine into supervisor mode (to write to the port address), why should all interrupts be suspended? I'd like a routine I've installed running off the Timer A interrupt to continue unabated whilst the centronics port is written to. In other words, is possible to put the machine into supervisor mode whilst leaving the Timer A interrupt enabled?

As I say, what I'd really like to do is to write to the port without disabling the Timer A interrupt!

(Actually what I'd really *really* like to do is to write to the RS232 port without disabling the Timer A interrup, but I guess this is another matter altogether. Here I'd guess that other interrupts have to be disabled otherwise the timing of the serialisation process would be compromised. And so I'm settling for the centronics port).

TIA . . .
-
Steve Wilson

Not really but issue Kbdvbase() and disassemble the relevent interrupt
routine. The docs for Iorec() will tell you the buffer layout.

Then how does one access the addresses where the ST keeps the
x,y text location as asked in the ORIGINAL question???
I know I can put the cursor where I want with ESCY commands,
but how do I find where it WAS before I issue the ESCY command,
so I can put it back there????

Longword at LineA offset -28. 1st word is column, 2nd is row.

>I am trying to control the cursor from GNU C.

Some points to note ...

1) The LineA is not officially documented but I expect you would get away with it.

2) The LineA variables can change at any time (ie system does a VDI call). As this is related to the text cursor though, you should find it does not get changed.

3) Due to (2) a multitasking system in theory could stuff the values there at any time. In practice it probably won't. On the other hand, there is no guarantee that the variables will even exist on an alternate OS. If they do exist they may only be valid in certain contexts.

For portability you would be better off starting with a known cursor position and keeping track of it yourself. This method would also work in a vt52 window for example.

Erm, I'm not too clear on your paragraph above? I'll take it to mean
coding ...

Usage: ls [-adlrt] [file ...]
When used without options or arguments, ls prints on stdout the names
of all files in the current directory, sorted alphabetically. If used
with argument 'file', it prints only 'file' if found, or an error message
if not.

```
Options:
        -a      List all files (including '.' and '..')
        -d      Treat directories like files
        -f      Flag directories with trailing "\"
        -l      Use long format; give full information on file type and date
        -r      Reverse the order of all sorting
        -t      Sort by times, normally newest first (default: sort by name)
        -w      produce wide listing (defeated by l)
```

so it is really only a case of using the ST functions

Fgetdta() Fsetdta() Fsfirst() Fsnext()

with appropriate formatting and filtering. Output should be via fprintf(stdout,...). The redirection of the output is the responsibility of the command shell.

>That's right... I was reading my manual, and realized it meant that. Still

>them in, putting them into the array, and then sort.

qsort() would be the best solution for MWC because shellsort() has a bug which iirc limits its capability to 32K arrays.

From your description you could adopt one of two methods - either scan the file then allocate space for the structure array and its contents or use a linked list and allocate as you go. The first method is easier but you would have to adopt the second if the file scanning took too much time. Using qsort() on the 1st is trivial

```
qsort(array_base,num_array_elements,sizeof(structure),sort_func)
```

the 2nd method would require you to create an array of pointers

```
p = calloc(num_array_elements,sizeof(structure*));
qsort(p,num_array_elements,sizeof(structure*),sort_func)
```

>: MagiC does not suffer from the 40 folder bug. One thing I forgot to
>: mention is that the shell gets as far as creating the redirected file.

>: to issuing an Fclose().
>
>It doesn't? Most interesting. I gotta get it sometime. So the shell just

>'forgets' to close the file after creating it? Apparently there's no error
>checking if I'm understanding you right.

I wasn't too clear. When TOS creates a file (Fcreate()) the directory entry is created immediately. Fwrite() can then write as much data as it likes but unless Fclose() is called that data gets lost and the file ends up as zero length (lots of floating clusters). As MSH ends up leaving a zero length file then it almost certainly means that MSH must have barfed before Fclose() else the file would contain _something_.

>: Here's a section showing how I added some newer Gem functions. Boring,
>: but perfectly possible. It could be simplified further with the MWC
>: library code sources because crystal() could be used I guess.
>
>Read it, but it looks more like assembler to me. I'm considering trying
>68K after I learn it some more. I never really got into 6502 assembler
>when I was playing with my 8bit. However, if I wish to get a little more
>complex, I'll use GCC and its updated command listings.

It is. I was showing it is still possible to upgrade MWC for new system calls. With access to the crystal() function source it would probably be possible using only C. My guess would be that new AES and VDI functions could be added simply by adding parameters to a table.

>: gemdos, bios and xbios functions are trivial - simply define a macro
>: in the same manner as the relevent header file.
>
>The compiler creates the headers for you, though all you need to do is
>write the actual coding yourself, according to the stuff I've been going
>through. There are some header files that you don't write, that I've seen
>that merely help out in writing your program.

Simply adding this to osbind.h is all that is required to make MWC support Bconmap(), a function that was not around when MWC was written

```
#define  Bconmap(a)         (long) xbios(44,a)
```

It's that easy!

>There's a QBBS.H file in the LazyBBS source code I've read through

Try emailing some of the people who've posted on the coherent group?
Surely somebody there must know who took over MWC?

That done, I think it can be said that enough effort has been made to
track down the copyright?

I bought Nark Williams C version 3.05? in the UK in (I think) 1979 or 1980. By that version all the manuals (apart from CSD) had been compiled into one huge mega-manual of around 1000 pages. As far as I know CSD was never bundled and had to be bought as a seperate product. In fact (if memory serves) I had to order it direct from MW in the USA since I couldn't find any British mail order company that stocked it. It snuck through customs in a plain brown padded envelope with a customs declaration saying there was nothing valuable inside! MWC 3.05 thru 3.09 (which is I think the last version) come on five disks and CSD comes on one disk. It is an excellent debugger with every feature you get nowadays in Delphi or CodeWarrior (and most of them worked better!)

Because I bought CSD from MW directly I got sent their various final offers including the opportunity to buy the complete source for all the libraries (I didn't).

Adding calls to new functions in the ROMS is very simple. crystal.s is provided and is the assembler binding. It is heavily commented and you just add the new function call's bindings and write the rest in C. Thats how I added the calls to the extended file Selector (the one that lets you add a custom message in the file selector). Accessing the STe's sound hardware took no more than writing a header file and a small library of functions (an evening) to make it simple in future.

Although it is a *very* K&R compiler it is one of the best - and the optimisation flags *really work*. The assembler provided is more than adequate for those little hacks required for the Vertical Blank Queue or Cookie Jars.

I'm writing this from (fond) memory as I 'upgraded' to a PowerMac in March/April '94 and sold my 4Mb STe (with NeoDesk etc) to my musician brother-in-law as a MIDI workstation...

If there is any (UK) reader of this post who wants MWC/CSD with all the manuals etc (in other words a legal transference of title to the software - no bootlegs here!) I *could* try and get them back (since he probably isn't using them!) but I imagine he'd want a few quid for them...

And it does seem *strange* that with 40 Megabytes of RAM and 1.25Gb of hard disk it seems to take *longer* to compile a project now than it did then - but thats probably nostalgia...

Hi all,

I have recently started to program GEM. I'm doing everything in assembler, you probably think I'm stupid, but that's the language I'm most familiar with. 8-)

However, I would like to know how to properly hide the mouse cursor while updating graphics on the screen (in windows etc). As far as I know, you should not use Line-A, correct?

PS. If there's anyone else out there programming GEM in assembler, it would be nice to get in contact. DS.

In a way, it's coding, yes, but you mentioned a way to get the TOS code disassembled, like the German people did with MagiC. I'm familiar with the ls command, as my provider is on Suns, and uses the Unix software. Been using it for years, though I've been on for close to two years, on a shell account, never have gone SLIP or whatever.

: with appropriate formatting and filtering. Output should be via
: fprintf(stdout,...). The redirection of the output is the
: responsibility of the command shell.

Sounds about right, or so it seems. I'll later on check the MiNT sources and see how they do it. I've saved your message to a file for later use. If you're using it on a modem environment, you'll wish to direct the output to both serial and console. I'll read up more on those commands.

: >That's right... I was reading my manual, and realized it meant that. Still
: >am a bit of distance from finishing up reading it.
:
: It takes a while!

A mouthful it is, all right. Wish I could get a second manual, as it looks like I'll be constantly referring to it. I emailed the fellow who does the ST version of gcc, and asked him about a command listing, like a 'reference card' of sorts, that I could refer to. He says it should be in the archive of the gcc source code, in texinfo. Gotta check that once I get MiNT installed. Been a little busy lately. Installed a 1.6 gig drive and CD ROM into a desktop case, replacing the old ICD case, for easier access when necessary. I'm enjoying it. Even have a 50 meg partition just for MiNT itself.

: qsort() would be the best solution for MWC because shellsort() has a

: bug which iirc limits its capability to 32K arrays.

That's what I'm gonna use. I located some other sorting routines, all using qsort, including one that's a bubble sort. A friend of mine was talking about this sort of thing.

: From your description you could adopt one of two methods - either scan
: the file then allocate space for the structure array and its contents
: or use a linked list and allocate as you go. The first method is
: easier but you would have to adopt the second if the file scanning
: took too much time. Using qsort() on the 1st is trivial

I'd say the first one is good, as I'll be allocating and deallocating as I go. Transcendence has two user files, the first is just a listing of users and their handles. I'll read that. I'll have a struct arrayname of that, plus of the main user file. Once I get the number of users who are on, I'll call the next routine to sort according to your qsort line. Then on to the others, using that same qsort line being called when needed. Before I get started, I'll write up a short routine to list how many, and so on, and add to it as I go. That way, I'll have fewer errors, and the job isn't too daunting.

Like I said, a two-dimensional array, or maybe multidimensional, is what I'll be using, containing the user's handle, number of calls, downloads, uploads, and posts. Qsort will be used on that.

: I wasn't too clear. When TOS creates a file (Fcreate()) the directory
: entry is created immediately. Fwrite() can then write as much data as
: it likes but unless Fclose() is called that data gets lost and the
: file ends up as zero length (lots of floating clusters). As MSH ends
: up leaving a zero length file then it almost certainly means that MSH
: must have barfed before Fclose() else the file would contain
: _something_.

Guess someone made a nice-size programming mistake. Always include one close statement for every time you open, or check to see if it's already open before you issue the open command. Then when you quit the program or system, you get bad clusters, zero-length files, etc. I see that every now and then with some people who have horror stories of this sort of thing. I once tried defragging a friend's old IBM system, and I mean old, a microchannel. [gag] He had bad clusters all over. Every time they got fixed, more would show up, and to make things worse, more programs and directories would disappear. He takes one look at me, obviously knowing I'm getting nervous, says he'll format and reinstall. heh... Same thing can happen on any computer if you're not careful.

: It is. I was showing it is still possible to upgrade MWC for new
: system calls. With access to the crystal() function source it would
: probably be possible using only C. My guess would be that new AES and
: VDI functions could be added simply by adding parameters to a table.

Most interesting. You mention this below. This is something I have to try myself sometime. Remember I'm still trying to get started in C, and am

searching for books, and have found, but not bought, them yet. Toad and Ben Smith both have some good ones. There's one I located not long ago that's not an Atari one, but will get it anyway due to the good reviews it's gotten from users. It's The Waite Group's C Primer Plus. I don't know if it sells in the UK, but I'm sure it may.

: >There's a QBBS.H file in the LazyBBS source code I've read through
: >that's in the umich archives, that seems to be a QBBS style message
: >base setup, though you have to be the one to write the actual message
: >base. Shall I post this file?
:
: ER, I dunno!

Go ahead and get it. If you can't find the file, I'll post it here for you and all. It's a pretty short file.

: From the date of the last update and the address (same as my manual),
: plus the routing you post below it looks like this could be well out
: of date. :-(

Yep. Looks like it. Joe Dennison, former MWC.com contact as you saw earlier, contacted me, and said for sure MWC is gone for good. The InterNIC has not yet removed them from their whois databases.

: Try emailing some of the people who've posted on the coherent group?
: Surely somebody there must know who took over MWC?

Likd I said above, I may have found something. Dennison gave me what looks like a possible address, so I'll be checking it out. Heck, I could probably write a text file on what I've done in my MWC searches! Now to do a crosspost on here, c.s.a.st, and c.s.a.8bit about searching for the TBBS and Forem ST authors. As you remember what I said earlier, Matt Singer said he had given the source to a couple other people, but can't remember who. So, I'm hoping someone in those groups would remember, as it seems none of those, except for a few, are here in the c.s.a.p group.

: That done, I think it can be said that enough effort has been made to
: track down the copyright?

Not yet! :-) Still am trying. Got loads of mail for awhile when I got started in the searches, and still have most of those mails, which number about 20. Once I do some more, and still fail, I can honestly say that I tried, with you and Rich backing me up, as well as all those who are reading these threads.

I've started a new thread about compiler optimization, since this one
is really about another matter.

>long's to short though 'cos MWC starts calling library subroutines for
>32 bit math! ...

Even for add and sub?
All the compilers will of course do that for the multiplication, but
as you'll see in my article only PureC actually did any multiplication
at all. I mention there that even PureC will of course use 'muls' if the
numbers are 16 bit integers.

[Clear loop code removed]

Now that sure isn't good!

[Double loop code deleted]

But that can't even work after the type of clearing I did!
It should give a bus error on the line:

```
>main_+0x4A      adda.l    (a1), a0
```

MWC has for some reason decided that 'array' is an array of pointers
to longs, but it isn't. It's an array of arrays of long!

(The C equivalent of a standard two dimensional array.)

It can't be legal to treat my definition/declaration of 'array' that
way. It certainly won't work in this case.

Are you sure you compiled the same program?

By the way, please direct followups to the other thread.
It's probably a good idea to include the code as well.

What happened to Michael Current's effort to get the same thing going?
In fact what happened to Michael Current? Anyway, if he is still around
maybe he already has some of the issues scanned. I had volunteered to
help but never got around to it. I do have some of the later issues
of Antic but I gave most of them away at the Atari Mistfest last month.

wtg (wtg@wtgab.demon.co.uk) wrote:

: into one huge mega-manual of around 1000 pages. As far as I know CSD was
: never bundled and had to be bought as a seperate product. In fact (if

Aha! That's what I thought. Looks like I was pretty much right on this one, saying that I thought CSD was not bundled with the MWC package. More history unfolding! Guy H, now you know. :-)

: Because I bought CSD from MW directly I got sent their various final
: offers including the opportunity to buy the complete source for all the
: libraries (I didn't).

[sigh] I wish you had. Would have been nice.

: Adding calls to new functions in the ROMS is very simple. crystal.s is
: provided and is the assembler binding. It is heavily commented and you
: just add the new function call's bindings and write the rest in C. Thats
: how I added the calls to the extended file Selector (the one that lets
: you add a custom message in the file selector). Accessing the STe's
: sound hardware took no more than writing a header file and a small
: library of functions (an evening) to make it simple in future.

If you can, can you post these? I'd love to take a look at this sort of thing, since I'm just starting out, and would like to see what others have done and so on.

: Although it is a *very* K&R compiler it is one of the best - and the
: optimisation flags *really work*. The assembler provided is more than
: adequate for those little hacks required for the Vertical Blank Queue or
: Cookie Jars.

I believe MWC, from the manuals, have an ANSI version, not just the K&R things. They released the ANSI version later on, I believe what we all have now.

: If there is any (UK) reader of this post who wants MWC/CSD with all the
: manuals etc (in other words a legal transference of title to the
: software - no bootlegs here!) I *could* try and get them back (since he
: probably isn't using them!) but I imagine he'd want a few quid for
: them...

The only problem here is that MWC is no more. They went out in early '95 after being dormant in the Atari arena for several years. You can easily

sell the stuff to someone with no problems. Now just posting the stuff on the net, with the full executables and install disks, well, I don't know yet. I'm still attempting to get in contact with the former owner of MWC, Robert Swartz. I'm getting a little close, or so it seems.

I'd check who owns the rights now - but it would be nice to get some
sources. My particular need is for the command shell sources because
pipes and redirection don't work under MagiC. :-(

If you find out anything please let me know. :-))

There might be some hope. While they were in business they were very
supportive. I once sent them a bug report on 3.0.5 crashing which they
could not reproduce - they sent me a free 3.0.9 anyway. :-)

Do so, if you can. I was pretty much out of the ST and Atari loop for several years, like about 1988-1992. Lotta stuff to miss. I still do have many of my magazines, both 8bit and ST, that I can check through, though I'll probably start out with the year 1988 or 1989, from when I've heard it went under or something. I'm still finding out about things that I missed from time to time, though I'd heard about the MIST fest every now and then. However, one slight bonus I have is that in my MWC manual, I have an 800 number. 1-800-MWC-1700. This big tome is quite surprisingly clear of other writing, other than the 312 number in Chicago, and the 800 number. Also included with the disks and the thick manual are two other manuals, the Resource Editor and csd C Source Debugger, all clear of any writing, and in very good shape. I'm gonna spend a little time checking what's on the floppies, though I seem to be missing the first two disks of the update of the csd debugger.

I've not played with MagiC yet. Right now, some of my time is spent learning the language, and reading the sources. However, I have been looking for a command resource 'card' for gcc. I don't mean the '-' commands, but rather, the C language commands it uses.

: I found it rather expensive here in the UK as well so I never bought a
: copy either. Trouble is, you can't get the old version in libraries
: any more.

It can be expensive, yes, but if you can find places that sell books for real cheap, grab them. I've located a few of them for $5 USD or less at times, and they're still in good condition, though they're for the IBM systems, but the examples are good.

: >I'll be checking around for who has what again. I did do some searches

: Good luck! :-)

I was checking with Toad on the Compendium book, but can't find it in there. Where to find it, I don't know. Probably time to scour the bookstores again like I did when I was searching for this one 10-volume book for me to read

There are some separate `make' utilities around (check out atari.archive.umich.edu), of which the best (I guess) is the GNU make, but I'm not sure whether that one works without MiNT.
You can easily set them up to use your C compiler.

Good luck,

Hi everybody!
I'm searching for GCC 2.7.0 for MiNT/TOS somewhere in the net. There is a commercialized version (CD-ROM for a heavy 30-40 buck$) but I'm not interested in paying a lot of money for some kind of freeware!!!

The reason why I'm looking for GCC in this version is that GCC 2.3.3/2.5.8/2.6.1 for MiNT/TOS has serious bugs avoiding to compile programs such as

mkisofs without errors (there are no warnings but the programs do not work
due to some compiler errors!).

Regards,
    Torsten

P.S. Please contact me by EMail!

Help! You might have seen earlier post by me in this area. I am trying
to update Kermit, without enough knowledge of *C*.
    I have MWC, the program the Atari parts were written for. So far,
I have gotten the latest version (192 beta) to compile and run, at least with
all of the capabilities of the 3-year old (189) version. That version
was VERY limited, and had no DIAL or SCRIPT capabilities. These were
not included because the Atari has no signal/alarm capabilities.
    Now there is a version for the MAC and for the Amiga, that have the
full system enabled. The MAC parts are very complicated, but the Amiga
version LOOKS simple. The main problem right now is, There are apparently some
system calls that I can't figure out. I need a VOLUNTEER to help me
figure out how to translate the Amiga calls to Atari, so the MWC can figure
them out.
    Anyone who helps will of course be duly acknowleged. I
have the sources for both versions.
    Can anyone help????

> Has anyone played with Lattice C, version 5.60? How good is it?

Quite good - much better than 5.06.02 that I owned earlier, however it
does have a few features that piss me off - especially under MultiTOS.

And, if you are using MultiTOS, you can't change to a different app until compilation is finished. You can't even call a DA or some other innocuous util. (I often get ideas half way through a 25-minute build on my TT, and cannot test them out without aborting the build.)

And the way it seems to love to hang my machine when it has two megs of RAM consumed and I try to open a fourth or fifth window - it requires a "switch it off" cold boot - the whols system has hung. It's not that I have run out of RAM. Far from it - I have at least 8-10 megs of TT RAM free at that point.

(I run Mint 1.12 with memory protection 'on')

I'd have liked a way to mark a window as "read only", so version 2.17 of my masterpiece from three weeks ago won't be accidentally altered instead of the current version.

(Sorry. I just guess I am in a bitchy mood. it really is a good product if you can spare 3-5 megs of hard drive for it. It's much faster than version 5.0)

Hello,

I am writing driver software for a PC keyboard attached to the
MIDI ACIA of the ST. The driver converts scancodes from the PC
keyboard to equivalent Atari scancodes and then jumps to a
subroutine in the ST ROM that handles this scancode and puts
codes in the GEMDOS keyboard input buffer.

The problem now is how to find the address of this routine in ROM.
The Xbios call Kbdvbase gives vectors to routines to handle about
every type of messages from the keyboard, except for plain scancodes.

I found out that in TOS 2.06 the longword immediately before the
KBDVBASE structure is a vector to this routine. To make my driver
work for all TOS versions, I want to know which versions of TOS
use this undocumented vector. Does anybody know this?
And does anybody know at which address the routine is located for

the TOS versions that don't have this vector?

I know that jumping straight into the OS using an undocumented is
bad programming and highly non-portable, but I want to make a version
of the driver that does this because it then has the full Atari keyboard
functionality, including CNTRL+ALT+DELETE, ALT+HELP, ALT+(SHIFT)+UP/DOWN/
LEFT/RIGHT, ALT+ascii code etc. The portable version of the driver will
probably only contain code for 'normal' keystrokes.

Thanks,
Pim.

>Rich Tietjens about this.

I;m no lawyer, but my opinion is: You should make a legitimate effort to
contact the last-known copyright holder(s); write any snail address you have,
perform a search on both the company name and program name on AltaVista and
Switchboard, post a query in several of the business newsgroups. If, after 30
days, you are unable to find/contact the copyright holders, place a disclaimer
in the archive (which I assume you will be creating) stating exactly what
methods you have used to try to contact the copyright holder and what results,
if any you have had, and that you will immediately withdraw the archive from
general distribution if anyone with a legitimate claim will contact you at
(your email address and your snail address).

Of course, if you are able to contact the owner, request their permission to
distribute. If they refuse, you should not post the exact text they used to
do so, (of course, if all they say is "no," that will be next to impossible to

avoid), but you should post that information - and wher to contact them - here, and any other place you feel it would be apropos. If they agree, again add a disclaimer as above with current contact information.

>There's some stuff in there, though I've not
>looked at the files on the disks, that seem to require a manual, about the

>Raytrace on it. Shall I post this, now that I heard STF is no more after
>they release their final issue?

Magazines usually don't object to reposts after a year or so, but again, contact the publisher. It's plain courtesy, if nothing else - and if they plan to release a compendium, they may tell you so and you can start garnering interested potential customers for them.

>I've not heard anyone reply to my question about Matthew Singer, author of
>FoReM XE, FoReM ST, and a few other versions of FoReM. Is the source code
>for the ST still around? I ask, as I want to see how it was written, as it
>helps to have a few examples of BBSes written in C, if this was.

You might try contacting the "authors" of Turbo BBS, as Matt stated on many occasions that they had stolen his source code outright. I haven't heard from Matt in many a blue moon <G> and I think he's moved on to something else.

>: Let us know if you do put them on-line.
>
>I may do so only with the blessing of other people. If I get a lot of
>people saying they want me to do so, I will. I don't wish to lose my
>account on my ISP over this.

Given the foggy issue of copyright, it's best to try as I outlined above. I doubt that anyone except Prodigy or CompuServe (maybe AOL) would pull your account after you made an honest effort to contact the owner and failed.

BTW, in case onyone is interested, I contacted Joe Blenkle (author of the doorgame "Cows!") and he's alive and well, although without an ST. I don't know if he can still generate registered versions of Cows! but it's a fun game - well worth a trip to AltaVista to find Joe if you have a BBS that needs a wacky door.

Well. You don't have to use a trap at all. Just place a function pointer
into the cookie and call the functions through that interface. See
the XHDI spec as an example (http://wwwmath.uni-muenster.de/~reschke).

I have an ATARI and want to convert the files on this
machine to ascii files for MSDOS.
Is it possible to find such a converter?
Many thanks in advance.

Just got off the phone with them - both products will be released this week -
and they are for the Amiga. We should join our "cousins" in celebrating this
new release, although it's of little use to us Atarians.

: cannot test them out without aborting the build.)

Very annoying, all right. I'm trying to gather more info on writing a BBS
program, and have some stuff, but I don't quite get how the info is picked
up from the modem. Still am reading some of this stuff...

It would be nice to be able to use the computer at the same time a user is
on the board. As you can see, I'm just starting out. However, what with my
previous programming with Basic, Cobol, and some Pascal, it's made easier.

: (Sorry. I just guess I am in a bitchy mood. it really is a good product
: if you can spare 3-5 megs of hard drive for it. It's much faster than
: version 5.0)

That much space is easily spared if you got a gig drive like I do...

However, someone mentioned in an email to me that it puts out code that's
not exactly fast. What's up with this?

Thanks for the info.

Thankfully I don't use TRAP #6 (address VBR+$18 on 68010+ machines,
$00000018 on 68000 systems).

BTW: Are TDI Modula-2 and RTX comaptible in their implementation of Trap #6?
(Just curious)

I do believe it is based on a project from a German computer magazine. It
is now available as a commercial project from Toad (http://www.toad.net)
in the US and (IIRC) System Solutions in the UK. I don't know who the
Finnish distributors are. Toad's Web page does have a reasonably good
description of it.

(Oops: Brain wasn't plugged in fully when I typed that - the offsets from
the VBR should be $98, and $00000098 in 68000 systems)

It wasn't too hard to get MWC working under MagiC. The MSH will run
happily in a VT52 window, although in the end I found it better to put
the environmental vars into MAGX.INF and remove them from PROFILE. Now
MWC will run run happily from within MSH, by dragging a source to my
CC.PRG icon, or better still, I can just hit CTRL-SHIFT-M and MAKE
will be invoked on which ever window is active. If it wasn't for the
broken file redirection, it would be perfect!

Announcing Peter's page of Atari Sound and Midi programs and resources.

Midi and Sound

Links to various Midi utilities, algorithmic music, sound editing and
creation. I have searched around for the most useful, interesting
programs and resources and this page is the result. No pictures, just
the facts :)

Please note that the page is aimed at ST and not Falcon , mainly because

I dont have a Falcon.
Any comments and further leads would be appreciated..

: Trouble is I haven't the faintest idea where to start!

That's my starting point, since my manual was dated 1988, and there's the references to it being not released any more for the STs a year or two after that. That's your starting point, on all ST mags, maybe the one that went out here in the States a few years ago. They were always reporting on some of the very good stuff. My Chicago friend sent me a couple boxes loaded with these mags, so I'll be looking around there. If anyone has other references, let me know, better yet, post them!

: Is there any response from those telephone numbers these days?

Yep. My response to Rich will tell you about it.

: >what's on the floppies, though I seem to be missing the first two disks of
: >the update of the csd debugger.
:
: I never got csd myself. :-(

So you got the original issue of csd, then?

: It wasn't too hard to get MWC working under MagiC. The MSH will run
: happily in a VT52 window, although in the end I found it better to put
: the environmental vars into MAGX.INF and remove them from PROFILE. Now
: MWC will run run happily from within MSH, by dragging a source to my
: CC.PRG icon, or better still, I can just hit CTRL-SHIFT-M and MAKE
: will be invoked on which ever window is active. If it wasn't for the
: broken file redirection, it would be perfect!

Since MagiC is copyrighted, and it's a little expensive for me, I'll wait

a bit til I can afford it. I've seen the newer GEMulator that doesn't
require the hardware card to work. It's nice. I'll be installing MWC soon,
to play around with it to see what to expect.

I see Toad is still selling Prospero C. Wonder if I can update it... Gonna
try soon on that one!

For pure ASCII files, you don't need any conversion. The special
characters (umlauts etc.) might get mangled up. You can't convert the
Hebrew characters, because MSDOS doesn't have them.

Check out the IdeaList package (probably on hensa or umich archives). There
is a helper program called BLINEX that will convert them for you.

I have a couple of questions about the SozobonX libraries. I was able to
install SozobonX system, get it running, and compile my C course projects
with it, so everything should be set up correctly. However, there are a
couple of "standard" functions, namely atof() and strtod() that don't
work. Trying to use atof() make the linker claim that it can't find the
symbol _atof, which is strange, because it's in the archive libc.a.
A similar message results when I try to use strtod(), except strtod is in
utils.a (or something similar) rather than libc.a. Dearchiving the .o
files stops the linker from complaining, but either I'm not using the
functions correctly or something's wrong with them, since they're not
working properly. I am aware that the double arithmetic in SozobonX isn't
there (or is broken). Would a cast as float solve the problem? I didn't

try that, since I really only wanted to convert strings to integers and
ended up using atol().

That is easy. just format a Disk on your Dos Computer (to all: is this
really necessary for disks?) and put the ASCII File from your Atari on
it. Then carry the Disk to the Dos Computer and read the file (not you,
let the DOS Computer do that. This is something even MSDos can do ;-).
This should be all you need to do for this "conversion".

Rich Tietjens (RichardX_Tietjens@ccm.jf.intel.com) wrote:

: Remind me to get in touch with you about Baudot code (I want to write a TTD
: emulator for the Falcon).

TDD/TTY emulators are interesting. There's one already out on the net, so search under handicap archives. I do know that there's this exact archive out at oak.oakland.edu, and there's a program for the IBM systems. The Baudot code I don't know, since I don't have the specs with me. However, I do own a TTY, and it gets used a lot. You should listen to the tones coming from it, as each letter is different. Due to the federal requirements of the ADA (Americans w/ Disabilities Act passed in 1990/91), all states were required to provide the Relay Services, so each state has its own number.

On my homepage is a link to the Deaf WWW and a link to learning sign language, both of which can give you a starting point, as well as using deaf as a keyword for a Yahoo search.

Aha... Reminds me. I tried the 800 number using the Relay. Twice. Both times there was a male answering the phone. Both times he said he didn't have time, and hung up, giving the operator no time to reply. How rude. Maybe someone else can try if I keep having trouble with him?

: There is the misc.business hierarchy, and alt.business - I'd go with misc
: first, because alt tends towards spam, as we all know. %^(

Right, I know about spam... Most of what I read are in the alt.* groups. Spamming galore. I was considering crossposting my message here and there, so we get maximum coverage, and both groups chat freely. However, we may not need to, from what I've found. More below.

: >of the files on here and around. A CD ROM of their best sounds good.
:
: I'd buy that.

heh... One buyer already! I've got a number of them, and it'll take time to really go through it. A CD burner or whatever would be a little expensive, but I can always send it out to someone to do it for me. What's the address of the editors of STF? Can someone bring Frank Charlton here, and see what he says about this?

As for the international copyright thing, that effort will be made, but I'm not the only one to be doing this, as I'd like others to help out as well. How about it? We're mostly talking about companies that are no longer, and the owners can still prosecute for illegal distribution.

Finding the owners is a little difficult at times.

: I don't run Turbo and don't have much more than that to give you. It's no
: longer supported, either AFAIK.

That's what I figured. Neither are supported at the present time. However, I have found a number of Matthew Singers, and he's still at the Framingham, Massachusetts, address, or so it seems, from using Switchboard. AltaVista revealed a little more. I have his namesakes, or him, at Case Western Reserve University as a student, and at fau.edu in Florida, from the 8bit FAQ. A bit far from his Massachusetts home. Email has been sent, so I should have a reply after you read this, hopefully.

: This is definitely off the wall. Bits of it are off the planet!

Cows! it is, I'll nab, and see how it goes. And I thought my medieval assassin game was a little wild what with the way the prompts and responses are at times.

: >Off to AltaVista it is for me to do some checks. [Another One Bites The
: >Dust in the background - hehe] Gonna do it anyway. [grin]
:
: Good luck!

OK... Lots of things I've found, plus a couple emails waiting for me when I logged in today. One was on a question of Singer, like I said above. The second was on MWC. He mentioned an address, 60 Revere Drive, Northbrook, IL, 60062, 847-291-6700. The company went under according to an archived message I found, in February of 1995, though the company became inactive for the last several years. However, there's mention of Coherent, a Unix operating system clone of sorts, if I understand it right. Many, or at least some, of the former employees of MWC can be found on comp.os.coherent, and our Professor Boris has been talking to some of them on there. There's a few text files I found, that might be of interest, if anyone wants me to post them. All this was in a couple hours of searches.

That last mail also mentions of people attempting to get in contact with the owners of the MWC copyright, and not having much luck. It's merely one person doing all this. I'd rather have help doing this if I have trouble locating certain things.

> That much space is easily spared if you got a gig drive like I do...

True. But if you are using a computer that came with a 48 meg drive (as
my TT used to until late last year), it can be a bit tight.

The 5.60 installer still puts a lot more stuff on the hard drive than
needed (one can, when one is familiar with Lattice, delete the unneeeded,
so Lattice only takes perhaps a meg or so)

> However, someone mentioned in an email to me that it puts out code that's
> not exactly fast. What's up with this?

Compilation options can be the biggie.

The "debug with register flushing" compilation mode is guarranteed to
slow things down - especially if you write code that uses tight loops (an
interrupt handler grabbing data "live", for example).

This is a problem with all compiled languages, especially when the compiler gets a different idea of what the code does to what you want it to do.

But you can also run the app through the supplied optimiser (an optional phase in the compile process) to speed it up by 10% (I believe that the manual gives that figure - I have never actually got that much of a speedup from it)

But even then it isn't the fastest.

If you are familiar with 68k assembler, you can speed up the "wading through treacle while pulling a fully laden logging truck" slow bits by writing in assembly language. (Or engage the assistance of a 68k assembler programmer)

The enclosed debugger, MON is good, but will not co-operate in MultiTOS. I've emailed Hisoft, and got a less than helpful response ("That's how we wrote it, and it's just a fact of life that it acts that way in the presence of MultiTOS")

Lattice is still better than Megamax C, although not as fast as Laser C (both in compilation and code produced). But it beats Laser in being able to run on my TT, and in being able to output '030 code.

There`s a GNU tool out there, called recode that handles all sorts of
character-set specific conversions of texts.

It also handles the Atari character-set and makes it possible to convert
the first to almost any other machines` alphabet and vice versa.

The character sets comprise lots of ISO sets, ASCII, several PC and Mac
sets etc. It is available (binary) at:
    ftp://ftp.uni-paderborn.de/ataritools/util/recode34.zip

Or as source code at any server that got a gnu directory.

I've never had any copy of csd. I found the undocumented (in the lexicon) -VCSD switch in CC.PRG by accident one day when messing with a disk sector editor. The level of comments generated along with -S meant I could trace bugs back to source lines anyway.

I wish I knew what in MagiC causes MSH to have broken pipes and redirection!

It might be possible. I've got Prospero Pascal and if I ever had reason to use it any more, I reckon it's flexible enough to add new calls to.

My 3.0.9 came on 5 disks - I never got csd on any of them. Should
there be a sixth disk?

Probably depends on what version you have. I have the csd manual, so I
know it's there. Seems most of the posters here never got it, though some
did. I'd like to find out who did and didn't.

: >Since MagiC is copyrighted, and it's a little expensive for me, I'll wait

There's mention that TOS can somehow be decompiled, which is how the
German people came up with MagiC, fixing a lot of bugs in there. I'd love
to see the original code.

: It might be possible. I've got Prospero Pascal and if I ever had
: reason to use it any more, I reckon it's flexible enough to add new

I was doing some checks on AltaVista and a few others, so I'll see what
else I can find. Some things exist with MWC, while not so with Prospero.

Reminds me... I was doing some heavy checking with the search engines and
then some. Found a few more people who were running Forem ST, and so on,
and got a couple messages, one about possibly where I can find the other
person that Matt had given the source to Forem, and the person who may be
the copyright owner of MWC, and suggested reading comp.os.coherent.

I'm on my way...

Great! Let me know what you may plan on doing with it.

: Rude, indeed. What's the number? email me here at Intel and I'll give him
: buzz.

Just emailed you on this... Let me know what you find.

Reminds me. I just got a reply from Matt Singer. One of two emails to two Singers netted him, in a pretty fast response, though short. Maybe someone else can help out with some things he said...

He said that he had given the code to a couple people, but who, he can't remember. Anyone know anything on this? He also talked about the TBBS program, a clone of his Forem ST program, and said that the people hailed from Canada. He'd rather forget about them, probably an interesting nightmare that happened. Finally, he mentioned that there was someone who edited his ST-Term to PD-Term, and posted it all over. I'm going to check back with him later, to see if he still has his old ST stuff around.

I don't have much info on the Turbo BBS program, but if someone used it, and still has it somewhere, let me know. I'll be checking with AltaVista, but I think the IBM systems have something similar.

Does anyone know the correct number of words per line in 320 x 200 16-bit
color mode on the Falcon? Logic says 320(pixels per line) * 1(16 bit
color equals 2 bytes or 1 word) for a total of 320 words per line. Is
this wrong? I ask because if I fill the first 320 words of screen memory
2 lines are drawn. It must be an easy answer but I'm stumped.

Nicholas

I originally purchased 3.0.5 - there was no csd with it. MWC sent me
3.0.9 after I wrote pointing out a bug. If 3.0.9 came with csd on a
disk of its own then I suppose I could have missed out on it, not
having purchased 3.0.9 directly.

>There's mention that TOS can somehow be decompiled, which is how the

I did a tiny bit of investigating of the broken shell. The bug is
always the same. Even a simple "ls > z" ...

r_look.c: 52: assert(p) failed.
waiting for newline ...

[then MSH quits]

This appears to be down to Fforce() and Fdup(), although I'm not
certain of that - I'd have to do some test code to refresh my memory.
It might just have been MWC's dup() and dup2().

MWC is easy enough to upgrade for newer OS functions, especially TOS
ones. Gem ones are a little more longwinded but still easy.

Hi all GFA programmers!

I am currently updating my website, and want to include a page for GFA programmers, since I have found no such thing on the web. I already have a page for Face Value (GFA-tool) and a general Atari page...

I need your help. I want to collect all patches, utilities etc, so people can download (or preferably pointers to FTP...). I know about A La Card, M_TUNF, GFA_PATCH (1.07?), but I am sure there is more (a FAQ, f.ex).

Preferably in english, but I have resigned to the fact that most of the good stuff is in german, so that is ok, too. Just make sure to explain what it is (my german is a bit rusty...:-).

Please e-mail: vegard@interlink.no

Really? I'm using Mint 1.12h3, and it's generally been rock solid for me, even when I'm doing programming. Of course, I _am_ running it with memory protection on, so that may make a difference.

I'm sure it does. If there were a plug & play 030 that could replace my 68000 CPU, I'd try that. There's not, AFAIK, however, so I'm stuck with MINTNP in the AUTO folder when I want to run MultiTOS. I think my version of Mint is 1.12f-something, I take it there's a later binary available?

CAB doesn't really hog memory. It is only sloppy bloat programming from
guys who write code for the Windows 3.1/95/NT environ that sees fat and
greedy software released. They have little choice in the matter with the
environ they choose to run. A JAVA interpreter should be able to be
compiled for the Atari platform (perhaps '030 or better), but the big
problem will be in getting Sun to agree to license the source to you. To
get hold of JAVA source requires big biscuits despite the net.myth.gossip
that says JAVA will be a multi-platform thing for anyone who wants it.
Get real Sun!!, thats why we have only seen major corporations come out
with JAVA plug-ins so far...

In this instance, Portal is correct; I'm sorry, I must have unconciously added
the ".st" in the middle of that.

> I for one have been right here on comp.sys.atari.8bit on and off for nearly

I can email you a complet newsgroups list, if you need it. It's rather bulky
at about 350k, but if Portal won't tell you waht exists, I will. IMHO, any
and all "warez" groups that exist are pirate groups, and I won't subscribe to
them, even if I can find them (there are several listed in my NG file).

Not only that, but an unmoderated group doesn't depend on the whims of one person to give it content.

> > comp.binaries.atari.st should be removed. Despite the continued

> > where virtually nothing was valid for the group.
>
> This is probably a relatively valid reason for removing a group.

This would be a valid reason /IF it were true/, but it is not. Submissions wer made - and ignored. I submitted several files in the omnths prior to the group's demise, and I have seen others state the same thing; no response was ever forthcoming from Annius. I don't know if that means he did not get the files, or simply chose to ignore them.

> > The Atari ST is no longer a very active platform,

> used to "support" the suggestion/recommendation/decision to remove a group.

It's tantamount to saying that "the 286 is not a much used chip any more, so we will no longer write software that does NOT use 386 opcodes." Granted, there is a lot of software that won't work without those opcodes - but probably 90% of the current DOS-based software, including most network drivers for Novell networks, work just fine on 286 boxes. I doubt that the owners of those networks using 286 servers and clients would be very favorably impressed by anyone who told them that they would be required to give up their existing hardware platforms.

> another (I forget which) of the Windows NT groups...

It's also the way things are done, and frankly, it blows. Getting an alt. group for Atari binaries effectively removes the controls exercised by the "Big 8" cabal (and such a cabal obviously exists, else it would not be necessary to put a new group proposal to a "vote").

The fact that the question was posted in comp.sys.atari.st is true. The allegation that "the vast majority agreed" to rmgroup it is either a mistake, or an outright lie. Since I don't know if the person making the statement knows the truth or not, I will assume it's a mistake.

Hi,

Has anyone got some assembler source to save a .gif from ST-low or a PI1/NEO to GIF conversion routine. I need this to save screendumps from 320*240*16 (4 bitplane) into a common picture format - and PI1/NEO only hold 5/6 of the screen.

Thanks,
Yiannis

: Umm... guys, I went through the trouble of creating

: alt.binaries.comp.atari8bit a while back - why not use
because it is for 8bitters, and we'd be interposing on you. But thanks
for the offer.

: The only thing that would really be better than the
: existing group would be a new one in the 'comp.*' hierarchy (sp?).
the "existing group" was removed more than a month ago :(

: If someone wants to try and push that through, I say 'go for it'!
YEAH!!! Let's push it through!!!

I don't mind if it is alt.binaries.atari.st or comp.binaries.atari.st
just as long as it isn't moderated and I can freely post and read from it.
I don't even care if we posted binaries to the non-binary groups, however
a lot of people have a problem with that, so I say stick with creating a
new one!!!!

I was just wondering which of the 68000's TRAP vectors are used by
software (apart from the obvious OS vectors, of which I am familiar).

A few years ago, I found that I was including the same pieces of code
(system interrogation, cookie Jar creation/interrogation/editing, etc) in
nearly all of the custom apps that I was writing for various people.

So, I wrote a smallish (16k) TSR to be loaded at boot time that contained all of those functions.

In order to simplify the program-to-TSR interface, I used the TRAP #0 instruction to call it from the main app.

However, it occurred to me that someone else may be using that vector.

Firstly, does anyone actually use that vector, and if so, what for?

Also, if that vector has already been claimed by something, how do I detect it, and what other TRAP vectors are available for me?

AFAIK, the only claimed vectors are traps 1, 2, 13, 14, which leaves the other 12 (0, 3 through 12, 15) free. I therefore chose Trap #0.

Now that I am starting to write more horizontal apps (as opposed to the vertical apps I have been doing so far), I wish to ensure that my Toolbox (the 16k TSR called via a "Trap #0" instruction) will not interfere with more mainstream apps.

Do you use Multitos on it? MiNT in the console is very stable in my experience.

That is just because people ported Java only to the major Platforms at the moment. Javasoft (doughter of SunSoft) do licence the source of the JDK to everyone who won`t use it for Profit for free. You will have to sign a Non Disclosure Agreement and then you can Download the sources from their ftp Server. You can not expect Javasoft to do all the porting to all the Platforms available.

Erm, no. Java is compiled. It's relative Java-script is interpreted.
It _is_ still byte-code compilation, which means that there is overhead
in interpreting the compiled program, but it is much lower than the
overhead of dealing with full interpretation like javascript.

This means that the Atari should be able to deal with Java much like
other machines (ie: Not much slower than native code).

Downside: I have reports that Java requires _enormous_ amounts of memory
to run. Can someone confirm or deny that? Reports I'm hearing are on the
order of 'if you have less than 16MB don't even bother'.

Heck, didn't Microsoft finally drop all support for other languages and
go for Visual Basic as it's 'official' language, to minimize support
requirements?

Dollar Bill doesn't like to look foolish, and I think the arguments
behind that move would make him look that way if Microsoft suddenly
embraced Java after all they said recently.

Sorry if I'm a little incoherent. About to dash for work.

D

Bonjour,

j'ai achet$ un gps portable Garmin 38 pour faire du bateau. Les gps
portable $tant d$pourvus de clavier dignes de ce nom, l'entr$e des donn$es
est assez laborieuse. Il existe des logiciels sur PC et Mac pour
communiquer, via la prise RS 232, mais je n'en ai pas vu sur Atari.
Quelqu'un a-t-il dj vu ce probl$me trait$ quelque part?
Merci d'avance.

Hello,

I bought a Garmin 38 gps for using on a boat, but this kind of gps have
not a true keyboard, and entering the data is quite long and difficult.
There are softwares for PC and Mac for communications with the RS232
socket, but I have never seen one for Atari computers. Has any body ever
see this question dealt?
Regards.

If you find any, let ME know, too. I am going crazy with the differences
between different versions of C. The libraries are ALL different, and
you can't find out what the other were supposed to do.

I got ansist a while ago and even got the source from the author. It's now PD.
True, it's ANSI, but WITHOUT the vt100 parts, and is in assembly. (which
is not too bad since I understand assembly better than *C*).

Guy, I am including the balance of the comp.sys.atari.* groups in this discussion along with alt.config; it may be appropriate at this time to include news.groups as well, but I will wait for comments before doing so.

Guy Harrison wrote:
>
(I include here quotes from a couple of previous posters in the same thread - to save time, I'll reply directly to these as well.)

> >> this group are primarily interested in a place to illegally
> >> repost copyrighted software.

This comment (whose poster may remane nameless unless he wishes to step forward at this time) is frankly slanderous. As the proposer of the new groups, /and/ an established software author, I take personal umbrage at

the expressed implication that I am a pirate. I suggest you ask the former BBS sysop and the author of RatSoft BBS how I feel about pirates - of course, he may not be aware of just who blew the whistle on his pirate activities.

> >> Annius V. Groenink <avg@cwi.nl> posted messages to the group asking
> >> whether anyone still found it useful and the vast majority agreed
> >> that the sensible thing was to remove the group. At the request of
> >> the moderator and the readership, it is now removed.

This is patently untrue. Annius posted one or two messages in comp.sys.atari.st remarking that he was planning to have the group rmgrouped, but the "vast majority" most of the readers most certainly did NOT agree to remove the group. I think most of us simply found it impossible to get anything past the moderator. Personally, I voted to retain the group.

An now, back to Guy's remarks:

> I attempted to post to this group on more than one occasion - at

>
> Guy Harrison
>
> guy@swampdog.demon.co.uk

It certainly appeared to me that the rmgroup was "railroaded" though. No voting results were cross-posted to the comp.sys.atari.* groups. By that time, however, the rmgroup was a /fait accompli/, as they say, so there was little anyone could do about it.

Any book that says it teaches C programming should hopefully do that.
If the book is reasonably good, it shouldn't matter much if it happens
to be named 'C programming with SuperC v 4.5.2a for the MegaMic III/2'.
ANSI C is (more or less) machine independent.

>If you find any, let ME know, too. I am going crazy with the differences
>between different versions of C. The libraries are ALL different, and
>you can't find out what the other were supposed to do.

Uhm, what differences?
The ANSI standard is rather specific about how everything should work.

If you're talking about Atari specific things like GEM etc, that has next
to nothing to do with C, but even then the differences are relatively
minor.

The MGIFv5 sources are somewhere around 700kbyte (excluding all libraries)

and compiles fine under GCC, Lattice and TurboC/PureC (I've never tried
them under any other) with very few '#ifdef' modifications.

A couple of data structures used by the AES and VDI (and I recall one from
GEMDOS) have somewhat differently named components under the three
compilers for some reason, but that isn't difficult to find or handle.

I remember fetching some rather good AES/VDI documentation from
atari.archive several years ago, but I can't recall the names(s).

The MWC lexicon contains a wealth of examples. Also the C programmers
reference from Kernigan & Richie is well worth a read. I believe it
was updated to cover ansi so try and get an older version. Any C K&R
programming book will suffice for the basics. There is documentation
available off the net but I don't know where and can't vouch for its
quality.

The only atari reference book I know of which is still in print is the
compendium, reputed to be extremely comprehensive.

I need the ability to multitask GEM programs, so, yes, I tried to use MultiTOS. I can't say I'm terribly impressed with the speed, and since I can't keep it running long enough to tweak it, I don't imagine I ever will be.

The new MagicPC demo has impressed me, however, enough that I intend to buy MagiC for my Mega STe as soon as the money comes together.

: I have one of the latest versions, 3.09. MWC ain't no more!

Hmph... So they went poof long ago. Found an 800 number inside the main
manual. Now that they're gone, I'm wondering if it's possible to post all
the updates on one of the Atari binaries, one of the newer ones. The ones
for csd and so on would be good.

Has anyone played with Lattice C, version 5.60? How good is it?

: If you find any, let ME know, too. I am going crazy with the differences
: between different versions of C. The libraries are ALL different, and
: you can't find out what the other were supposed to do.

For now, it seems you may have to install MiNT, and install gcc with it.
That way, you have a working Unix-like system. I'm about to do this, and
possibly use MWC, alternating between the two.

What have you written so far? I'm about to write a Top Ten or something
like that listing for Transcendence, and possibly adding support for other
BBSes out there.

Reminds me... Is the author of FoReM ST still around? How about the
source code?

I've been reading through the 500+ page tome of the MWC manual, and whoa, it's quite a good read. I've been seeing the K&R books, and located the newer books at the local bookstore, and they're a little on the thin side, and are quite expensive, about $35-40. Also have C For Dummies, which gave me ideas and more insight, as well as a few others. I'll hit the local bookstores and see if I can locate that old version of K&R. Just do a Yahoo search under programming languages, and pick the one that has the category of C/C++.

: The only atari reference book I know of which is still in print is the
: compendium, reputed to be extremely comprehensive.

I believe Toad has this. I have the catalog in front of me, but can't find the book, though I have the CD ROM. It's a little useless without the book. They do have the Atari ST Tips & Tricks, and I have the Graphics & Sound book. Bravo Sierra had something the last time I was on there, so I'll be checking around for who has what again. I did do some searches while at the MIST fest in Indy, and I only wish they had it more than once a year.

What version is this? The version I've seen around is 1.32. I'd like to
see if I can modify it for use without the . commands and use multiple
menus and so on. I've been reading through the code, but haven't located
this part yet. Guess I gotta look some more, and print it all out.

I can handle moderation - either manually or automatically. That's the
easy part. Getting the RFD accepted and passing the CFV is tough.

I don't believe so ... at least I've never heard of it.

> Also, if that vector has already been claimed by something, how do I

> detect it, and what other TRAP vectors are available for me?

You shouldn't care about that ... hopefully you are passing some kind of magic cookie to the interface that no-one else will pick :-) You should of course use XBRA to chain your trap handler to any others that may have been installed before.

But I think it would be less risky to change your TSR into a library of functions that you could include as required in your apps.

 Kermit probbaly already comes with a makefile. A few changes in the make file like changing cc to lcc or $(CC) and the CFLAGS,LDFLAGS macros and it will probably do everything. If I get a module that cascades messages I handle the file with the same options in the IDE until they are fixed and return to make.

  I have compiled berkely pd yacc and flex 2.5.2, for example, with the supplied makefiles and minor tweaks if any. Lattice although ansi will compile K&R code.

> Any thoughts?

I have a proposal all written up. It was already shot down in flames
after being submitted to the group mentors, but I am more than willing
to let someone else have the text to modify as they see fit.

Getting 100 votes is the toughest part - but I think it's likely to be a
lot easier now than it was before I brought the subject up in the entire
comp.sys.atari.* tree. I suggest a "straw" vote - who wants to be the
vote-taker? We will probably want to take a straw vote on each of the

following points:

Should comp.binaries.atari (all systems) be created?
Should comp.binaries.atari (all systems) be moderated?
Should comp.binaries.atari.8bit be created?
Should comp.binaries.atari.8bit be moderated?
Should comp.binaries.atari.st be created?
Should comp.binaries.atari.st be moderated?

I suggest that, if we can find a vote-taker, and if we can garner 100 or more votes in favor of any of the above "straw" proposals, that we then submit the formal RFD and try for the group. I'd also recommend a .d group (discussion) be part of the proposal for each binary group desired, so as to keep binaries and discussion seperated (in consideration of those who'd like to discuss the matter but don't have selective download ability).

I have decided to release ANSITerm 1.91 in to the public domain. I have
provided the executable because I cannot as yet find the source code.

You can find it at http://www.csee.usf.edu/~millert in the computers
section.

> MultiTOS.

MultiTOS is one of the most horrible programs available for MiNT. It is slow and insecure. Actually my Falcon with MultiTOS is slower than my old ST with Single Tos (in my feeling). I improved the priorities for the several Processes and at least got reasonable speed.

Tyhe biggest Problem with Multitos is that it won't rum with memory protection. This would at least save the programs from getting corrupted by Multitos.

> I can't say I'm terribly impressed with the speed, and since
> I can't keep it running long enough to tweak it, I don't imagine I ever
> will be.

Better try N.AES. This seems to be a lot more secure, but still won't run with Memory Protection.It is a lot faster then Multitos, and possibly improving the priorities may improve the whole performance as well.

There are Beta Versions of several free AES Clones as well: XaAES and oAESis. Both of them are definately faster than Multitos (that does not seem to be too difficult) and at least XaAES runs AFAIK with Memory Protection.

Gem Multitasking with MiNT is reasonable, as long as you don't use Multitos.

Johan Klockars (d8klojo@dtek.chalmers.se) wrote:

: Any book that says it teaches C programming should hopefully do that.
: If the book is reasonably good, it shouldn't matter much if it happens
: to be named 'C programming with SuperC v 4.5.2a for the MegaMic III/2'.
: ANSI C is (more or less) machine independent.

Remember you gotta deal with books that have errors in it. There's comp.lang.c and comp.lang.c.moderated that have been talking about books, and the moderated group has mention of what books have errors, no matter how glaring. My only complaint about the books is how expensive they are. I've seen some that I'd like to buy, but they're overpriced, like about $30+, and one I'd seen was about $50.

: If you're talking about Atari specific things like GEM etc, that has next
: to nothing to do with C, but even then the differences are relatively
: minor.

That's what the good Professor was asking. However, if you're going to be using AES and VDI, and some others, then you will have to keep it on the Atari ST side. Converting it to IBM format, well, it's harder.

: The MGIFv5 sources are somewhere around 700kbyte (excluding all libraries)
: and compiles fine under GCC, Lattice and TurboC/PureC (I've never tried

: them under any other) with very few '#ifdef' modifications.

I'm gonna install the MiNT OS later on, and use that while I run gcc. I merely have to find the installation disks, which I've seen 9 of them. I have the older version, but want the newer version. What exactly is this MGIFv5 thing?

: A couple of data structures used by the AES and VDI (and I recall one from
: GEMDOS) have somewhat differently named components under the three
: compilers for some reason, but that isn't difficult to find or handle.

Hmm... Interesting. I'll have to check the bindings for Prospero C and see how it compares with MWC. Someone's about to send me a Laser C book, so I'll read through that once I get it.

: I remember fetching some rather good AES/VDI documentation from
: atari.archive several years ago, but I can't recall the names(s).

I'll need to run onto there and do some searches, but will have to download the index. There's some other Web sites, like one on Rich Tietjens', that has some links. I don't have the link to his site handy with me, but if you read any of his messages, you'll find it.

It might be a good idea to add a formal PD release note to the archive
so that no one will be confused by the "registered users only" part
of the newto191 file, especially when users get it from a source
other than you web page.

I have seen compiled Java Programs on a Sun and immediately fell
asleep...
It is really very slow. Surely Interpreting the language directly would
be even slower, but this does'n make it better.

> Downside: I have reports that Java requires _enormous_ amounts of memory

Well, it does with Windows. I can't guess what ammount of Memory would
be needed on a Computer (not a Quick Toy (=PC)), but compared to the
usual difference in Memory consumptions of equal Programs on an Atari
and a PC, I guess, that 4MB should be enough on a Atari.

Does anyone know what the proper graphics mode settings are to get a
resolution of 320x240 on a Falcon? I know how to get 320x480 and I
assumed by turning 'double - line' on it would become 320x240 but it
turns out to be 320x200. Overscan gets the 240 but increases the 320
which is no good because I want the 1:3 aspect ratio. Any suggestions?

Nicholas

As long as I can't get either oAESis or xaAES to work with MiNT, I am
not going to spend any money for a completely untried AES replacement.
If it came with a complete, guaranteed to work MiNT package that would
be different.

> There are Beta Versions of several free AES Clones as well: XaAES and
> oAESis. Both of them are definately faster than Multitos (that does not
> seem to be too difficult) and at least XaAES runs AFAIK with Memory
> Protection.

But memory protection is not available on a 68000. And since I can't
afford a Falcon or TT (not right now, at least), it measn I'm not going
to have memory protection.

I did get the MINT030 binaries, and strangely enough, that works
reasonably well and is fairly stable. I need to study up and figure out
how to adjust the niceness properly (ALERT.ACC was burning 25% of my CPU
time and doing nothing at all as far as I could see), and I also need to
figure out how to make MiNT recognize that my serial ports are capable
of 115200 (it won't exceed 19200 on Serial2, which is simply stupid,
IMHO), but once those are doen, I think I can tolerate the slowness.
It's really not too bad with NVDI working (version 2.01, in case that
matters). The replacement file selector that's in GEM.SYS is almost as
good as Little Green FS, so there's about 30k saved anyhow.

I submitted several files in the last months the group existed, Annius.
I mentioned that here and in email; I never got an acknowledgement that
you received the files, nor did they appear in the newsgroup.

> Woy don't you ket der Files from das Ftp oder der Way Way Way?

I can do that, but all Atari users are not able to do so.

> (I can't point you to a site that has the `intel outside' logo if

I know. However, I would like to hear from others out there, especially Rich Tietjens about this. There's some stuff in there, though I've not looked at the files on the disks, that seem to require a manual, about the switches that the support programs use. Plus, the main manual is about 740 pages long, including the appendix, and so on. I'm not sure if I'm going to be the one to type all that in! :-) I did hear some time ago, someone did type in the entire GFA Basic manual, though I'm not sure what version. Yow. Lotta typing. There's an ST Format disk that was released a few years ago that had a GFA Special, and put GFA Basic 3.5, GFA Assembler, and GFA Raytrace on it. Shall I post this, now that I heard STF is no more after they release their final issue?

I've not heard anyone reply to my question about Matthew Singer, author of FoReM XE, FoReM ST, and a few other versions of FoReM. Is the source code for the ST still around? I ask, as I want to see how it was written, as it helps to have a few examples of BBSes written in C, if this was.

: As always, those of us who were too slow to get the lates updates before
: the company disappeared would be thankful for them now.

Like I said before, I picked this up at the MIST AtariFest in Indianapolis, together with a few other packages. When exactly did MWC go out of business? How good is Lattice C over MWC?

: Let us know if you do put them on-line.

I may do so only with the blessing of other people. If I get a lot of
people saying they want me to do so, I will. I don't wish to lose my
account on my ISP over this.

I posted to Hi-soft, and project files aren't used until 5.5.
Make is not until 5.6
Unfortunately I have 5.06.02. There appears NO way to compile kermit
with it. The Makefile was for MWC, which I have the latest (?) ver 3.09.
I can compile it with MWC, but I wanted to use a later, supported *C*.
I guess I am SOL> :-(((

Thanks for the response. I didn't think I'd get one, as most of the people who post programmer-ish stuff in c.s.a.p or c.s.a.s.t seem to be app programmers in Basic and C/C++. But I could be wrong in my appraisal of those groups.

An early hacker-ish "guide to programming the ST" (circa 1986-ish) published by Abacus (?) used Trap #3 for something - the local user group has the book in it's library available for members to borrow.

It installs a 'TLBX' cookie in the cookie Jar (or, if necessary, creates a jar capable of holding 64-cookies first)

I already check that the params passed are correct, as well as the calling protocol (which requires certain magic values to be placed in CPU registers). At present, if something is wrong, the disambiguator will return a null result to the caller. (That is less than ideal, however. Version 2 will improve that with a much better and somewhat faster disambiguator and dispatcher, along with a more robust calling mechanism)

Now where did I put my copy of the Compendium - I know it had some XBRA docs hidden in it...

> But I think it would be less risky to change your TSR into a library of
> functions that you could include as required in your apps.

True.

But if those ~12k of functions in the TSR are included in every program, it adds bulk to the apps.

And when one is running in a multitasking environment, where perhaps 10 different apps using those funcs are running, that means perhaps 120k of RAM will be used.

Assuming 15 functions in the TSR (I haven't counted them), each of 800-ish

bytes, that totals 12000 bytes of code resident. (the remaining 3-4000 being data/stack)

Therefore, a 40-odd byte interface in each of those 10 apps to each (potentially) 800+ byte function in the TSR is more memory efficient. (40x15x10=6000 bytes in the apps, plus the 16k TSR equals 22k. 800x15x10=120000, so 120000/22000 or nearly 5.5 times more memory consumed is the functions were statically linked to each app)

And of course, if a bug is found, replacing the TSR will fix all apps simultaneously, and only a 16k TSR needs to be shipped, rather than multiple megabytes of apps - assuming the bug wasn't in the interface function)

BTW: For those who are interested - I am currently extending it to allow the boot-time loading of external modules (such as graphics converters, disc editors, and so forth) as extensions that can be used by all loaded apps. (It works, but is a little hairy at times - my implementation was a bit rushed and hence poorer than it could be) It's almost like DLLs in Widows, but not quite as dynamic.

Thanks again for your response. I'll keep your ideas in mind next time I'm editing it.

>Both DATA and BSS are variables, though.

I thought it best not to confuse the issue too much, as it really depends on the language implementors. :-)

I know about $602C and the parameters passed on startup. Is there another way? [I dont have a Compendium :-( ]

While I think of it, is the "undocumented" pointer to parent's

basepage documented or undocumented still?

This might seem off topic, if so I'm sorry but this is rather important
to me so here goes. I would of posted this in the other Atari news groups
but nobody really reads those.

Is anyone in the Lima or Findlay, Ohio area going to the MIST Atari
show in Indian July 13th?

I'm wanting to go, but my car is unlikely to make it and would like
to know if I could ride with someone else. Forking out some money for
gas in not a problem.

Please e-mail ASAP if a ride to MIST is possible... thanks for listening.

Hello all,

I'm just wondering, how many ST's are around with less than 2 MB of RAM?
Has the Falcon more than 1 MB ?
I'm asking because my application does't work very well with only one MB
and I wonder if it's worth the time optimising it to reduce it's memory
requirements.

Huh? always? I'd say it depends on the amount of work and on the improvement possible.
Especially if 80% (ca 300Kb) of the code was not written by yourself, and you have to understand it first.

  if rsh_vrsn and 4 is not zero this is an extended rsc file.
If it is then there is first appended to the file a table of longs
the first entry is the real length of the file. The second is the offset
from the beginning of the file of ciconblks. (if it is -1 there are none)
  this points to a CICONBLK pointer table which is a table of 0L for each
CICONBLK. It is terminated by -1L. It is followed with the following
variable length structures for each CICONBLK.

```
  ICONBLK monoicon;      /* the standard monochrome rsc */
  LONG    n_cicons;      /* Number of different CICONS of different res.*/
  WORD    mono_data[x];  /* monochrome bit data *
  WORD    modn_mask[x];
  char    icon_text[12];
  for each CICON present for this icon.
  WORD    num_planes;
  LONG    col_data;      /* place holder calculatee during loading */
  LONG    col_mask;
  LONG    sel_data;
  LONG    sel_mask;
  LONG    next_res;      /* 1L == more icons follow */
  WORD    color_data[n];      /* the bitmaps in 'vdi standard format' */
  WORD    color_mask[n];
  WORD    select_data[n];
  WORD    select_mask[n];
```

Sheesh--are you certain? I don't know any ST owners who didn't
eventually upgrade to higher than 1 meg. Virtually every ST user (and
certainly every STE user--since it's so easy to upgrade) I know has
upgraded to 4 megs.

If there is a sinlge STE user out there today that honestly uses his
STE regularly and still hasn't upgraded to 4 megs, this is certainly
a good time to do so. I'll bet you could get 4 1-meg 30-pin SIMMS for
scarcely $50-60 US. And I'd say that's a conservative estimate.

You may be right, though... Perhaps a majority of ST users haven't
upgraded. I just find it odd if that's the case.

>eventually upgrade to higher than 1 meg. Virtually every ST user (and
>certainly every STE user--since it's so easy to upgrade) I know has
>upgraded to 4 megs.
>
 Your right to a point, I would be suprised to see any STe owner with
half a meg, and very suprised to see any serious STe user with the one
meg,
 But the only people you can be pretty sure of having more than one
meg are serious STe users, the guy with an ste who plays games, has a
wp, goes on the net, what reason has he to upgrade to 2 or 4 meg?,

  The STFM owner will be stuck at one meg, alright lots of you out
there with more I know, but on liners only account for ten percent of
ST owners, There are more STFM owners than STe, and its a total pain

in the arse to upgrade FM, Financially at least,

 I would say that most of the ATARI ST owning population have one meg, you look around and see how many 2 meg hungry software packages there are, because theres a couple of hundred one meg ones for each you could name, if 2 meg was the norm then ?.....

 I have a 2.5 meg STe, but if I wasn't a programmer then I could live very happily on one meg,

  Anyway they are my personal thoughts :)

Cheers.....!ynoT

We are looking to recruit an experienced 3D Flight Simulator Programmer to work in the West of England for one of, if not THE largest developer of interactive entertainment in the UK.

You will have experience of programming flight simulators for the home entertainment market and will have a good understanding of the techniques required to produce a first class 3D title.

Salary is competitive and this position is available now.

For more information, please reply via private email or call Paul Rose on 0181 423 3400.

We look forward to hearing from you soon.

Well, I believe that most people who still use their Atari regularly have upgraded the memory in order to take advantage of the newer multi tasking AES/OS...however, for this very reason, I'd think that minimising memory requirements is a good idea...of course you do have to consider the trade off...if it really slows down performance, or takes out features that are likely to be used several times a session, I'd vote to use the memory available. A good idea is to try to make the application so that it can run in 512k of ram, yet take advantage of all the memory available. This way those with 512 or 1 meg machines can use your program, and those with 2,2.5,4, or more meg can allow the application to take as much or little as he wishes...deciding speed/feature VS. memory requiremnets for himself.

Personaly, I use Geneva, and find my self most often limiting the memory used by each program to the minimum possible, and loading several applications at once. Exceptions to this rule are memory intensive applications like DTP, Graphics, large digital sounds, or coustomised packages like KCS Omega, or Logic...in these cases I give them all the memory I can...it makes them run faster and more cleanly.

Good luck at any rate,
Brian

having heard recently about JAVAs possibilities to "free us"
from Bill Gates and the intention of java to run applications
with very little memory consumption, or centralised
computer-networks, it occured immediately to me that a classical

Atari should do with that, quite fine ...

if the marketing-devision of atari (if they still have any :)
could work it out this time, "we Atarians" could expect pretty
nice time ahead of us ...

nobody needs a 200Mhz computer with 64MB RAM to run his/hers
operating-System, except the ones being tied to Microsofts
products ...

Escom tried to put out the Amiga as the network-computer again,
but the most certainly lacked much motivation, coz they failed
even before they had started it up in the first place ...

i'll see all those stupid PC-faces when little STs or even F030s
will do away with all this stupid Mircosoft-stuff ...

hopefully cheers

Well, Java is an iterpretative Language. So a slow Computer like the ST
wont do it too fast. There are People developing Online Compilers for
other Systems. This means, that the code is compiled and imediately run.

That may be a solution for the Atari. Eventually the Compilation will
get fast enough for the networking conection. Then this is useful.

> if the marketing-devision of atari (if they still have any :)

Well, Atari is not expected to do anything for that. I remember someoner
around in the Net started to port the Java Interpreter from Sun for
MiNT. Maybe that is a start.

> nobody needs a 200Mhz computer with 64MB RAM to run his/hers

Why should Microsoft not getting on with writing Programs in Java and
get on the nerves of all the Computer Owners who got around it so far?

> Escom tried to put out the Amiga as the network-computer again,
> but the most certainly lacked much motivation, coz they failed
> even before they had started it up in the first place ...

Well, the missjuged their financial capacity. They had to sell Amiga
before they could bring them out in their shops. So now Amiga is again a
Computer for a few people doing funny things and calling them
Multimedia.

> i'll see all those stupid PC-faces when little STs or even F030s
> will do away with all this stupid Mircosoft-stuff ...

Well, dream on. Microsoft will not be sleeping, and they wil start to
integrate Java as much as possible into their System and get it running.
I more think, that Intel Will be looking like a horse when all the
Standard Software is developed in Java So everybody with a cheap
Computer can run it.

Christof

Hi all,

Does anyone know how icons can be printed with VDI?
What I would need would be the raster functions on printers.
I suppose, I can't use the Polymarker function, since the dot mark won't be
a true dot on some printers. (otherwise I could print the icon by printing all
it's dots).

thanx, Simi

Atari read this. Can someone HELP???
I don't know *C*, tho I have programmed for years in other languages. However, I undertook to recompile Kermit to its latest version. The last was (189), from '93. The sources are now up to (192 beta). I have MWC ver. 3.0.9. The Atari version is a small subset of the whole thing. We are stuck with a vt52 emulation, altho most thing it connects to need at least a VT100. It has DIAL and SCRIPT, and many other goodies.
But it NEEDS a version of signal/alarm that is common in UNIX. I don't want to compile it under mint, cause it wants GEM. MWC has a signal.h and event_multi in aesbind.h. Can't these be used to make a dummy but functional signal/alarm??? I have compiled everything that doesn't need s/a, and it works. Using HSMODA6, it runs at 115.2 KB in a TT.
SURELY, someone, somewhere, has tackled this problem before? Or would be willing to help me do it myself? You would get full credit for your help.

There is no exact extension that lets you do this on a FM, if STe then there are extensions for accessing the blitter chip that will

allow it,
 It really depends on what you are doing and how much scrolling you
want to do, There are plenty of "tricks" and ways to do everything in
STOS,
 If you want constant scrolling in a game then any language has
trouble but even that can be overcome,
 Let me know what you are doing and how much you want to scroll?, i
know you say 1 pixel, but how many times?

Cheers.....!ynoT

A few months ago, I jumped platform from Atari to PC, but I had a lot of
software that I had developed for the Atari that I didn't want to go to
waste. So, I have archived it, and it is available at the following
address:

http://www.csee.usf.edu/~millert/computers.html

I am trying to update Kermit for the Atari. It is 3 versions out of date.
One of the things it needs BADLY is a VT100 console driver.
Surely, somewhere in Atariland, someone has written a PD driver???
    Any help will be GREATLY appreciated.
    This is for an official update, with Columbia's blessing.

Face it, Atari is dead as a dodo. Don't expect anything from "them".

> nobody needs a 200Mhz computer with 64MB RAM to run his/hers
> operating-System, except the ones being tied to Microsofts
> products ...

Someone else already mentioned that Java, being an interpreted language, requires quite a bit of processor power. Also, the browser packages which are around these days are pretty complex beasts. They also tend to be performance and memory hogs. To support such applications, you need a stable operating system with good communications support and more advanced features like robust multitasking and threading. Thinking a little more about it also reveals that much of the Web's fascination for average people comes from the graphical representation, i.e. from animation and colorful pictures. These are all things the ST line never was designed for. (The Falcon is, of course, better suited for color graphics.)

Worst of all, I think the "network computer" idea won't be accepted by the marketplace, no matter who makes the NCs. So even if the no-longer-existent Atari had a killer machine for the purpose (which they don't have), it would, IMHO, never become a smash hit.

I'd be glad if I'm proven wrong, but the only hope that I put into "the Atari market" is that at least for a good while I can find someone to repair my TT if it needs fixing.

You don't need a browser to run java programs. It looks as if many
Software houses begin to use Java as a programming language for bigger
aplications. Those applications won't be distributed as aplets, but in
Java 8 bit pseudo Machine code. They could be compiled to a real Atari
Application and then run quickly.

> To support such applications, you need a

You mean the Oracle Thing. It is interesting, but the problem is, that
most people buying a Computer really want to buy a Playing Console. At
the moment Networking is not too much interestin to the people. The so
called Internet Boom did not bring the Computer market into much higher
regions, and the internet just got slower with the WWW, because many
people now get their penthouse Pictures via WWW instead of buying the
magazime at the kiosk. So I think the time has not come for the Network
Computer.

Well, we could try and persuade someone at Medusa Systems, Overscan, or
ASH to do the job Atari did, and serve as developer source.

I personaly would prefere Medusa Systems to do it, because they also
develop the New Computers that are most likely to become the new
Standard Atari.

I once had a DSP-debugger, which I think was written by Brainstorm.
Anyway, I lost it when DataLight finally screwed up after some months
of thrustworthy expanding my storage capacity.

I can't find it anywhere on the net, so if anyone could give me a clue,
I'd appreciate it.

There are no "Net Police" (unless you're an AOL subscriber, they have a history of "cooperating" with the FBI to entrap otherwise law-abiding citzens).

Mail bombing is always inexcusable. Very tempting, sometimes, but still inexcusable.

However...

At one time I began writing a cancelbot becasue of idiots like your "Admiral." It wouldn't be difficult
to finish it. I'd release the source code. A corollary program is the BounceBot, that simply bounces
unwanted email back to the originator. This has the (desirable?) side effect of automatically mailbombing
anyone who mailbombs you, if you know it's likely to happen.

Anyone interested in the code?

Posted for someone whose Usenet feed is still flaky (their comp.sys.atari.*
groups are only getting about one article every few days)

I'll forward any responses I get...

--- SNIP ---

I am looking for someone with STOS experience who can help me with
sprite collision detection.

In particular, I want to know how to detect whether two sprites have collided,
and do something if they are touching. This is to allow the player's on screen
person to "pick up" and object. The object would be represented by a sprite.

Any example code would be appreciated.

Hi folks,

To cut a long story as short as possible, due to my own stupidity, my hard disk is currently "down". I fully realise I can be a complete plonker at times so I have lots of backups. Incredibly, it has been "inexplicable floppy failure week" - more died this week than have done in the last 9 years put together.

Consequently, it's going to take me some time to figure out what has gone altogether and what can be salvaged. I'll at least try to respond to email but don't expect miracles!

[feeble attempt at humour [sob]] ...

SwampDog paranoid quote of the week

THEY are *not* out there - THEY are in my sodding computer room, hopping up and down on my floppies wearing bloody great magnetic boots!

newsgroups: comp.sys.atari.programmer

I was just wondering which of the 68000's TRAP vectors are used by software (apart from the obvious OS vectors, of which I am familiar).

A few years ago, I found that I was including the same pieces of code (system interrogation, cookie Jar creation/interrogation/editing, etc) in nearly all of the custom apps that I was writing for various people.

So, I wrote a smallish (16k) TSR to be loaded at boot time that contained all of those functions.

In order to simplify the program-to-TSR interface, I used the TRAP #0 instruction to call it from the main app.

However, it occurred to me that someone else may be using that vector.

Firstly, does anyone actually use that vector, and if so, what for?

Also, if that vector has already been claimed by something, how do I detect it, and what other TRAP vectors are available for me?

AFAIK, the only claimed vectors are traps 1, 2, 13, 14, which leaves the other 12 (0, 3 through 12, 15) free. I therefore chose Trap #0.

Now that I am starting to write more horizontal apps (as opposed to the vertical apps I have been doing so far), I wish to ensure that my Toolbox (the 16k TSR called via a "Trap #0" instruction) will not interfere with more mainstream apps.

 Ok a quick and easy answer would be, I presume then you friend has
internet access, so why not join the STOS mailing list, normally used
for just such questions and answer sessions :) although a bit quiet at
the moment because most of them are students and gone home for the
school hols :)
>--- SNIP ---
>
>I am looking for someone with STOS experience who can help me with

 I do STOS :)

>In particular, I want to know how to detect whether two sprites have collided,
>and do something if they are touching. This is to allow the player's on screen
>person to "pick up" and object. The object would be represented by a sprite.

 Sorry there is no straight and simple answer, Do I take it your
friend doesn't have a manual, not being funny here but its pretty
simple in there to do sprite detection, you could even use a colour
detection and check for irregular shaped objects,

 But by far the best method is to use the Missing Link extension "MANY
OVERLAP" command, this will detect between hundreds of objects on
screen in lightning speed,

 *** tip to any stossers, manyoverlap for multiple object detection is
far faster than the straight overlap that detects one object, its
because the new "many" commands use a different code ***

 If you havent got that extension then the best advice would be to get
some copies of STOSSER diskzine, there are 26 issues (STOSSER 27 due
out soon) and each has a minimum of 40 articles, with over half STOS
related, the rest of the disk is filled with stos source, thats over
15 meg of stos source in the 26 issues,

Theres plenty on sprites and sprite detection, including my "idiots guides to using bobs" etc, try floppyshop in scotland,

There is no way I could send you an example routine as I have no idea what extensions you have or what you are really trying to achieve, some of the aboive would hopefully help ????

Cheers.....!ynoT

Guy,
It may be no consolation - but it has happened to most of us! Generally in the middle of something vitally important that's going to be backed up "in the next five minutes". Mine was a three day epic big band score!! Commiserations:)

x-mailer: UUCP-ST News_Out version 1.00 4 Jul 1996 Registered

This message inaugurates both alt.binaries.atari and
alt.binaries.atari.d

CHARTER:

alt.binaries.atari is for distribution of freeware, Public Domain, and shareware patches, prograsm, etcetera, intended for Atari and compatible computers. alt.binaries.atari.d is for discussion of the content of alt.binaries.atari and should never contain binary files.

The following are explicitly inappropriate for posting to either alt.binaries.atari or alt.binaries.atari.d:

- Copyrighted software without the EXPLICIT permission of the copyright holder to post the software.

- "Chain letters," "get rich quick" schemes, for sale messages, or commercial solicitations of any kind.

- "My computer is better than your computer" messages, or discussions of the relative merits of any computer system. These discussions properly belong in the various .advocacy groups (or alt.flames in some cases).

- Any posting whatsoever by Peter Sinclair-Day; he does not own an Atari or compatible computer, does not use an Atari or compatible computer, and does not hold the copyright to any known software.

Very large binaries (e.g., in excess of 500k) should be uploaded to an ftp site (or several) first, and the availability (with full path) announced in a.b.a; only in the case of a specific request by a user who has no ftp access should such large binaries be posted to the newsgroup.

It is suggested that a short text message be posted in a.b.a immediately before posting a binary, explaining the purpose of the binary, the copyright status and distribution policy pertaining to the binary, system requirements for use of the binary, and any special information which may assist in determining the desirability or undesirability of downloading the binary.

This is an unmoderated group. However, it will be closely watched by
the undersigned, and any blatant violation of copyright law will be
immediately reported to the violator's postmaster and the copyright
holder. Violations of netiquette will be referred to the appropriate
postmaster if it is deemed necessary.

b> Surely, somewhere in Atariland, someone has written a PD driver???
b> Any help will be GREATLY appreciated.
b> This is for an official update, with Columbia's blessing.

Boris, AIUI, ANSI is merely VT100 with color extensions; Tim Miller created ANSIterm, and there's source in his tsource.zip file (which is now PD). You ought to be able to crib from that.

Of course, if all you want is a generic console driver, use the ANSIST TSR that goes in the AUTO folder.

Yes, well, thanks but it doesn't seem to have worked. I'll ask here - does
anyone have direct root@domain access to send the necessary control messages
to try again to create these groups? I can email the necessary header(s) and
text if you aren't sure how it's done.

Hiya... I've been reading up on C programming, and following the
programming examples and coding of other programs out there. I've read
through the LazyBBS code in the Crawly Crypt 2 CD, and the Fnordadel

in the Umich archives. Also picked up on Mark Williams C (looks like version 3?), Prospero C (version 1.43), and Personal Pascal (vers. 2) from one dealer at the MIST Fest in Indianapolis.

What I'd like to know is if there are any newer versions of the above programs, especially MWC and PP. I've picked up the free public version of the Atari ST port of C in the Umich archives, though I've not read through the whole thing yet. I'm gonna try my hand at some BBS programs and doors in C. Since Transcendence has not had any updates for a long while, and a voice chat with Wayne Watson reveals he may or may not continue to port it over to C from GFA Basic, I'd like to try either writing or modifying code to use the existing files.

Also, I've tried searching for Atari books on this, as well as places on the Web and FTP sites. No go, unless I'm looking in the wrong places. Just about all of the places for C and C++ programming I've come across are for either the IBMs or Macs.

Hi Boris,
I tried to email my previous responses to your pleas for help, however
they both bounced, so here is a public response.

As far as Lattice C is concerned, the latest (5.6) has make, although
I haven't actually used it. If you're just doing multiple compiles &
links (and you have _some_ level of Lattice C v5), why not just use a
project file ... they're easy to set up.

If you'd like to continue this via email, please feel free to do so
(but please make sure your reply address is reachable :-)).

So maybe someone should look into Inferno and see if it has better
licensing terms for the Atari platform. AT&T announced it about a
month ago and has something about it on their web site if interested.

It's premise is more general than Java so it may be a better choice
in the long run anyway. Wayne

Sounds like your library is compiled to use short ints, and your program
to use long ints. The filenames on the library ought to stop this though.

I've got the Newnes 68000 pocket book which is full of wonderful info,
notably clock cycles for all the instructions. However, I'm looking for
some info on timings for 68020 and 68030. The 68040, according to this
book, averages 1.25 cycles per instruction. Pretty fast. The reason
I'm interested is because I was looking at some Falcon code and wanted
to see if I could speed it up (I'm still the demo coder speed freak I
once was!). I understand that the 68030 (and the 020? can't remember)
employs a type of parallel architecture to improve performance, along

with hard-wiring of instructions. I can only guess at instruction
timings with this lot running...

Hey, I don't see a nude picture of an atari anywhere on that list,
maybe then the people here would be interested. Go post in some smut
group.

> Anyone know the HEX address for the midi ports on an Atari 1040 STe?

Should be the same as on ordinary STs :

```
$fffffc04 (read  byte)   ACIA Status
$fffffc04 (write byte)   ACIA Control
$fffffc06 (r/w   byte)   ACIA Data
```

But why not use the operating systems function to access Midi ??

Cheers Peter

 I agree that this is not the place to post such advertisements, but what makes it
" ..
 base,immoral, perverted,"? and why are you the authority ? Funny but I have this
outmoded notion that consenting adults have the right to do what they want. Has

something to do with personal freedom.

All postings to inappropriate newsgroups are immoral, perverted, and corrupting.
Their content is irrelevant.

1) You, of course, _realize_ that by responding to this message you
are also crossposting, right?

2) The morality or lack thereof should not be the issue; the issue is
massively cross-posted advertisements of any type, especially those
appearing in inappropriate newsgroups.

3) See news.admin.net-abuse.misc for more on how to combat this spam.

4) Terminate this thread! Give it no more reason to exist. Start a
new one if you must, but this discussion really does not belong here.

   and what makes YOU think that everyone reading the newsgroup is a
consenting adult ??? postings should take into consideration that
minors have just as much access to these newsgroups as your consenting
adults do, the internet does no have a "18 only" sign at the front
door, would you post a sex advert somewhere you kew minors would have
access to it?,
  I have this personal freedom you speak of, but I dont think it
stretches to immoral perverted indecency,

Instruction timings on the 030 are much more complicated, since it
(IIRC) uses a pipelining scheme. The best reference are the Motorola
books, which you used to be able to get for free from a Motorola
distributor (in this part of the world anyway) by explaining that
you're developing code for the 680x0 line. There are 2 or 3 books,
one lists all the instructions & another one talks about the
architecture.

No, but I wouldn't post one anywhere :) Trying to make all the internet
suitable for kids is what the US government tried to do, and
fortunately didn't manage. There's no way you can prevent kids from
accessing wherever they want on the internet.

I agree that posting it here was totally inappropriate and wrong, but
posting it in say alt.sex would not be inappropriate, yet kids can
read that.

You know, everyone is speaking about the "right" to post anything up on the Internet. But with that right comes responiblity. You must remeber that not everyone wants to see this stuff and some should even see this like children. I do wish people who advertise this sort of thing will stick to speciality newsgroups instead of broadbasing it everywhere, it's like that in the real world BTW.

And those who feel that 'they' shouldn't have to be protected because the children must be, do you let your Playboys out where your kids can read them? Thought so...

Oh really? How many children have the money to buy their own computers these days? How many children have accounts with the phone companies or ISPs?

This isn't a free broadcast medium. It does take a level of knowledge and some non-trival expenditure of money on electronics to access.

So? The real problem isn't some spammer but some lazy slob of a parent that have no clue as to what their kiddies are up to and expect the whole world to be thier baby sitters.

Nevermind that the ad itself was not obscene (not even by American standards which are obscene themselves).

>door, would you post a sex advert somewhere you kew minors would have

Never seen a Playboy ad on TV?

> I have this personal freedom you speak of, but I dont think it
>stretches to immoral perverted indecency,

You have no CONCEPT of morality.

You must really cringe when you wash yourself.

 However, please keep in mind that this was an advertisement for lewd material, NOT lewd material itself.

A distinction should be made.

First, keep in mind that Usenet news is *not* restricted to the Internet.

> But with that right comes resposniblity.

For example, whoever you are, whichever of this long list of newsgroups you come from, *why* post it to comp.sys.cbm? *None* of this has anything to do with 8-bit Commodore computers. I bet most of the 8000 nude celebrity pics are in jepg format, which cannot yet be displayed on a Commodore 64 or Commodore 128. I know this didn't come from comp.sys.cbm. So I could trim comp.sys.cbm out and still get to whoever sent this to us 'in public', as they say, 'no private e-mail'. But what about the *responsibility* to avoid mindlessly posting this thread to umpteen different newsgroups because you are either too lazy or too unskilled to trim down the newsgroup distribution list?

Hint #1: if you don't know how to trim the distribution list, simply do not respond to a posting that was distributed to more than 3 newsgroups. It's that simple. If you are spreading this all over the place for no better reason than lack of knowledge or, worse, pure lazimess, *hold* *your* *tongue*. There's someone else out there who has the same opinion (or close enough) who is prepared to take the time to avoid this kind of spam multiplication.

Hint #2: if you don't *know* what a newsgroup is about, don't post to it. And it is no excuse to say, 'it was crossposted on my newsgroup, I just hit "reply".' See hint #1.

Virtually,

Eric Noss (mrmaddog@prolog.net) offered:

> You must remeber that not everyone wants to see this stuff.

AND I must also remember that not everyone is required to read a posting
with the nauseous word "nude" in the subject line. Goodness me!

Next Tony Greenwood (stosser@airtime.co.uk) cautioned:

> ...postings should take into consideration that minors have just as
> much access to these newsgroups as your consenting adults do. I have
> this personal freedom you speak of, but I dont think it stretches to
> immoral perverted indecency....

Few things will pique an adolescents interest more than for an adult to
tell them that something they see as pleasant, i.e., nudity, is "immoral
perverted indecency". God, what a weird attitude. You did notice that

interested parties had to SEND for this material, didn't you? It isn't distributed on the net and it probably will be MAILED to the recipient. Please note that there was no mention of donkeys, leather, children, etc.

Then Dave Baseley (dbaseley@cartech.com) ordered:

> ....[Blah blah blah (at least three bags full)]....Terminate this
> thread!...this discussion really does not belong here.

It's one of the fundamentals of discuss/debate, Dave, that you don't put forward your views and then imply that there is nothing more anyone else can possibly add by declaring the subject closed!

AND I'M GETTING QUITE TIRED OF YOUR CONTINUAL CROSSPOSTING, TOO, DAVE!

I looked in my old copy of The GFA Basic Book, and it includes code for reading the joysticks. I've translated it into an assembly function for C; hopefully everything works, but I haven't had a chance to test this, since I don't have an ST hooked up at the moment. :) But it's worth a shot:

```
; long joy_addr()

    .globl _joy_addr
_joy_addr:
    move.w  #34,-(SP)
    trap    #14        ; kbdvbas() -- xbios(34) function
    addq.l  #2,SP

    move.l  D0,A0      ; address to table of interrupt vectors
    lea     24(A0),A0  ; add 24 to find location of joystick vector
    move.l  (A0),old_vec  ; save the old vector for later
    clr.l   joystick
    move.l  #find_addr,(A0)  ; insert new routine

; if you assemble this with your C compiler, $16 below should probably
; be written 0x16
    move.w  #$16,-(SP)  ; this code allows the keyboard processor to
    move.w  #4,-(SP)     ; read and send values for both joysticks
    move.w  #3,-(SP)
    trap    #13        ; bconout(4,0x16) -- bios(3,4,0x16)
    addq.l  #6,SP

wait:                  ; wait for the joystick interrupt
    tst.l   joystick
    beq.s   wait
                       ; at this point, 'joystick' should contain the
                       ; address we want
    move.l  old_vec,(A0)  ; restore old vector

    move.w  #8,-(SP)   ; this code puts the keyboard processor back
    move.w  #4,-(SP)   ; in the normal mouse mode
    move.w  #3,-(SP)
    trap    #13        ; bconout(4,8) -- bios(3,4,8)
```

```
    addq.l  #6,SP

    move.l  joystick,D0
    addq.l  #1,D0      ; D0 now contains the address of joystick 0
    rts

find_addr:             ; A0 points to the input data
    move.l  A0,joystick
    rts
```

You should be able to use it as follows:

```
    unsigned char *joystick0;   /* address of first joystick */

    joystick0 = joy_addr();
```

The second joystick's address is simply joy_addr() + 1. To set the keyboard processor to joystick mode, use

```
    bconout(4, 0x14)
```

(This is bios function 3.) To set it back to mouse mode, use

```
    bconout(4, 0x16)
```

You can read the joystick values by peering at the contents of *joystick0. The 7th bit is set when the button is pushed. The 1st, 2nd, 3rd, and 4th bits represent, respectively, up, down, left, and right.

Hi,

Does anyone know of a program that supports the LAN port on my MEGA STe? I'm especially
looking for a program that treats this port as a high-speed midi port. I already tried the
HSMOD package, but the system crashed when using Steinberg's Avalon package.
The reason I'm asking this is because I want to speed up sample-transfers between my sampler
and atari. The sampler has a RS422 interface, which is the same as the LAN port, and
comunicates trough it using the midi protocol.

As far as I remember there are some options in HSMOD that enable/disable
interrupts. Did
you find that and/or tried it?

What is your variable declared as - a long? If so use %ld instead.
Be careful that the variable type matches the parameter in printf of which
there are several and many modifies such as 'l' for long.

Well I know I am risking looking like a total Donkey again, but I

have to ask :)

  The information passed between 2 programs, for instance clicking on display source in CAB will bring up a designated text editor such as Everest? run it and hey presto the source is loaded,

  I believe this is held in something called the "COMMAND LINE" please correct me if I am wrong on that, or slap me on the back if I am right :)

 Ok is this information held in a specific part of memory, can I simply point to and read the info, I want to get at it from BASIC if possible,

Cheers.....!ynoT

I also had this problem, but with another compiler; the use of the option
-l solve this problem (l for long)

You're not, just ask.

> The information passed between 2 programs, for instance clicking on
> display source in CAB will bring up a designated text editor such as
> Everest? run it and hey presto the source is loaded,

There are a few different ways for programs to communicate with each other. Programs using GEM can use the appl_write() - evnt_mesag() combination, thus talking via AES-messages. Commandlines are another (far older) means of communications. For data files it has been agreed upon that any program that finds a filename in it's commandline should open the file associated with that name. Thus editors open the textfile.

> I believe this is held in something called the "COMMAND LINE" please
> correct me if I am wrong on that, or slap me on the back if I am right

Show me your back ;-)

> Ok is this information held in a specific part of memory, can I
> simply point to and read the info, I want to get at it from BASIC if
> possible,

The command line is held in the second half of the basepage (address of basepage plus 128). The first byte gives the number of characters the command line consists of, then the actual characters follow.

A reasonable programming language should have some means to access the command line in more convenient way. C does it via some pointers that are parameters for the main() function.

Cheers Peter

Using my mailer REPLY feature I responded to a posting by Dave Baseley (dbaseley@cartech.com), deliberately crossposting as he had done while complaining about the practice himself:

>
> ...AND I'M GETTING QUITE TIRED OF YOUR
> CONTINUAL CROSSPOSTING, TOO, DAVE!

Rich Tietjens (RichardX_Tietjens@ccm.jf.intel.com) jumped in:

> Well, gee, Bob, since I don't feel like searching all of the
> more-than-a-dozen groups _you_ posted _this_ in to try to figure
> out where you were when you wrote it, I guess you'll have to live
> with cross-posted replies, won't you?

Sorry, Rich. I should have included some smilies for the humor-impared who don't recognize satire even when it hits them between the eyes!!!

It has been quite a while since I used STOS (the kids have it buried somewhere in the games pile), but there should be a command that looks something like:

stuff_I_want_to_know$=COMMAND$

where whatever is on the command line when your STOS proggy runs is passed into "stuff_I_want_to_know$" and you can then do whatever you like with it.

Keep in mind that COMMAND$ is subject to change, so you want to use this as soon as practical in your program. I do it before DIMming arrays or even opening windows.

 Unfortunatly my preffered language definatly does not have such a
thing, it was originally made with the specific intention of being a
fully fledged game development system, however many interesting and
usefull serious programs have been made with it, (by other than me I
must add) and the idea for a program that I have (none available as
yet on the atari but a much needed program<?>) would definatly need
the info from the command line, hmmm I live in hope :)

 Thanks but believe me, if it was that simple then I would have got
it, there is no such command in STOS, not even anything close, I wish
there was :)

! > eeerm sorry?, basepage ?
!
! From scratch ...
!

! A throwback to MSDOS is that the operating system considers a program
! on disk to consist of 3 parts. There is a section for the machine code
! instructions (TEXT), and two sections for data. The first data section
! is for variables which never change while the program runs (DATA), and
! the second section is for variables which do change while the program
! is running (BSS). This layout allows a suitable operating system or
! language to abort a program which is going wrong. Thus, on disk you
! will find a program stored as TEXT+DATA+BSS in that order.
!
! All this information needs storing somewhere whilst the program is
! running - the basepage. Probably due to the pecularities of intel
! processors a whole "page" (256 bytes) was used for this.
!
! When the os loads a program, it creates the basepage first and stuffs
! relevent information into it. Next comes TEXT, then DATA, then BSS so
! we now have basepage+TEXT+DATA+BSS. When the os finally jumps to the
! machine code at the beginning of TEXT the information on where the
! basepage is is passed as well.

Nothing to add, I guess, this is comprehensive.

! TOS maintains a pointer at $602C to the basepage of the currently
! running process. You could try something like this to see if it works
! (excuse my lousy pseudo basic) ...

This certainly is a way to go, if no facilities are provided.

```
! basepage = 32_bit_peek($602c)
! num_bytes = 8_bit_peek(basepage + 128)
! for i = 1 to num_bytes
!    a$ = a$ + 8_bit_peek(basepage + 128 + i)
! endfor
! print"command line is";a$
```

As far as I see, this should do the job. However, the peeks have to be done in supervisor mode, as the process pointer lies in the second kB of memory (the first two kB can only be accessed in supervisor mode, the GLUE chip would launch a bus error if this would be accessed in user mode).

! I do not know how consistent the use of $602C this is across different
! os versions though. You'll have to experiment! :-)

As the process pointer is a documented feature it has to be supported by every TOS clone, MiNT, MagiC, etc., and really is, AFAIK.

Cheers Peter

Hi Everyone,

I am trying to compile and use E-Gem 2.20 and am having some problems.

I have Lattice 5.5, Pure C 1.0 and I'd like to get it working with Lattice. Can anyone give some pointers to
getting it to work? The docs say I need to use the makefile but I dunno how - Lattice doesn't have a make
utility - will any old one do? Or should I download GNU C and try that? If I do get GNU C, do I need mint to run
it, or will it run under TOS/MagiC?

Any help will be appreciated.... thanx guys,

Hey all you guys, don't waste bandwidth (and forgive me for wasting it too).
Do you honestly believe that the original "8000 pics" article poster gives
a rat's ass about netiquette? If we give it more exposure, that's just what
the poster wants.

I say we just ignore it and go on with our respective newgroup discussions.
If he insists, we can all personally and *privately* volume-spam-mail his
account. A breach of netiquette is ignorable, an insistent b1FfHeaD should
be stopped with his own methods.

My $0.02 ... MZ

I have had a few replies to the command line problem, a couple of possibilities are in the pipeline, but due to STOS being STOS then they have problems,

I really hope this isn't too lame, but would it be possible for someone to knock up an assmebler prog that when run would place the info into the post mortem area as it would be safe there, no matter what,
so original program runs .....then calls..

prog that puts filename into post mortem

that prog then runs my prog

i retrieve the info needed and act,

then my program eeeerm runs the original?, eerm or would that run auto or would i have to have that info so as to re run the original?

Cheers.....!ynoT

Not quite. DATA corresponds to variables which have an initial value.
Both DATA and BSS are variables, though.

> I do not know how consistent the use of $602C this is across different

There is a legal way to obtain the basepage address for the currently
running program, for all versions of the OS. It is documented in the
Compendium.

That's none to clear, but what about a program that acts as a shell for your STOS
proggy? You simply send the full path of the STOS prg on the
command line followed by the desired STOS prog's command line; the shell writes
the command line to a temp disk file (we can call it
"command.txt") and then runs the STOS prog, which then opens the command.txt file,
and if appropriate, deletes it.

Easily done, I could knock that together tonight if it will serve your needs.

> possible,

Well, AFAIK there is this system call called "exec". It will start your Programm with ypur comandline and your environment. The Pathname, the comand Line, and the environment are Parameters for this call. It executes the named Program and returns back. I don't know how it is used in basic, but it works in C.

Now in the called Programm the simplest (only) way in C is to name two parameters for the Comand Line, i.e. an integer holding the number of parameters, ant a Field of Strings holding the parameters. then you can just read them out.

I have no idea how to do that in Basic, since the last time I used Basic for a serious Program I was sitting in front of a C64...

Hello,

I am currently writing an editor for my JX8P synthesizer
and I want it all neat 'n clean with GEM.
I looked at the seceral RCS editors available but none
of them supported sliders... Are there some extensions
that I could use, or do I have to progrm my own sliders,
any experiences with this?

Thanks in advance,

Florentijn van Kampen

I'm afraid that you will probably have to program your own,
sliders are not a base Gem object but are built from several
objects (buttons, draggable items, etc). Maybe there is a
custom software library out there that helps with this?

Hi,

Sliders are related to AES windows. Ressources, and thus ressource editors, are related to AES object trees.
If your program is using windows with sliders, this has nothing to do with any ressource that this same program may use. Windows, with their sliders if any, deals with the interaction between the user and the program. So, of course, you (i.e. your program) must manage the sliders yourself, using appropriate AES calls.

Cheers.

Linux/m68k supports it, or will support it in the future, I think.

Hello everybody,

I'm a quite isolated french developper working on a program
called Eureka 2.12. It's a 2D numerical analysys program, and
a 3D object modelling of mathematical shapes. It include
also 4D presentation, because a time parameter is available.
I'm in degugging phasis, so I would need experienced people
to tell me oppropriate comments on strengths and weaks of
my production. If anyone of yous, wood be so kind as to
play the role of awared critic on my work, it would be
a great help for me ...
I must precise, that my work is in french for the moment.
If anyone has ideas about it's translation it would be
great ... Anyway mathematical langage *is* international.
My program is available by FTP on the "Conservatoire
National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari
or on my home page at :
http://www.ief.u-psud.fr/~lecoat/
Anyway the last release is on my home page ...

Thanks for your help ... Bye for now !

Well... well, JAVA is not in any way depending on X11. It is developed
only by sun soft. Other companies have paied them for being able do make
java compilers for comercial stuff. One can also download th Java
Developer Kit Scouces for free, if you sign a declaration by sun. I
hered (ie. not at all sure) someone was going to port it to MinT. I
don`t know what happened to that. I think, that as soon as it is
available CAB won't be long to suport it.

If you are not using using AES windows then you will have to build your own sliders completely from scratch either low level via the VDI or using G_BOX's suitably organised. Some of the graf_???() functions could help you here.

It is a little simpler with AES windows, mask in H_SLIDE, V_SLIDE into wind_create() as appropriate. and use wind_set() to position and size them. When you interact with sliders then the AES sends you a message.

Note a proper calculation is a little more subtle than would first be apparent. This is how to calculate the slider position - you will need to rearrange the formula to calculate "window_start" from the new position from the AES message you received.

position = 1000 * window_start / (total_length - length_seen)

window_start = position displayed at the beginning of a window - ie if line 40 of a doc were at the top of the window then this would be 39 (start at zero).

total_length = doc length in lines - maybe 2000 lines for example.

length_seen = how many lines currently fit in a window.

If you were processing an image then the above would be in rasters perhaps. That is, the formula is based on units of the same logical

entity. It does not matter what that entity is, as long as the values are supplied in units thereof.

A 200 line doc with 20 lines visible in a window currently displaying line 40 would result in 1000 * 39 / (200 - 20) = 216 which is not quite the 200 which you would initially expect.

```
Now issue wind_set(,WF_V/H_SLIDE,position,)
                      ^^^
                      whichever
```

The slider size (the white bit) is supposed to represent the percentage of the total doc which is currently visible ...

size = 1000 * (length_seen / total_length).

Note that where the document is smaller than the window then values will start going out of the range 0..1000 and some extra processing will be required.

Also bear in mind not to let overflow occur in the calculations.

Try SysGem 2.03 (Very easy to use, but Pure C only.) or E-Gem 2.20. Both can be found on ftp.uni-kl.de/pub/atari/programming/

>      show "on-screen item has been dragged"
>      change mouse back to arrow (graf_mouse)
>    end if
>  end if
>rest of processing ...

Call event_multi..
    if event is a mouse button pressed (down) and
      mouse over a draggable object then
        event_multi(mouse_up | timer = 100ms)
        if event is timed out then
            change mouse shape
            loop
                event_multi(box | timer = 100ms | mouse_up)
                if event = timedout and old_mouse_pos != new_mouse_pos then
                    redraw outline shape endif
                if event = box then
                    undraw shape endif
                if event = mouse_up then
                    exit endif
            end loop
        endif
    endif

note.. box is a little box a couple of pixels either side of the mouse..
if the mouse leaves this then it's time to move the shape... the timer
delay means you don't waste time redrawing or blitting a shape when the
mouse is moving quickly... the event_multi calls means other AES stuff
can go on in the background.. as well as task switching and so on...

Just my tuppence worth..

Neil

Does anyone knoew how to get the files IMPORT.H and EXPORT.H needed to
build the GFA Mydial module?

I need them to build the GFA 3D Mydial module.

Regards,

What is the best and most safe way to find the Bits/Plane for the resolution you
are running in.

Is is Int{L~A}, or is this not safe anymore.

Should I use Work_Out(13), does this work on true color graphics cards and the
Falcon030.

Also, will Work_out(0) and Work_Out(1) always return the X & Y for the screen,
even on graphics cards.

Any help would be Great!!

Thanks,

Jim Fouch

This can be stated very clearly : It's the best way to use VDI, and it's
not safe to use any Line-A. Line-A doesn't exist on most graphics cards.
But the documented VDI behaviour should work on every ST style computer.
The Work_out return values you mentioned are of course documented and can
therefore be used safely on every machine.

Cheers Peter

You should use ONLY AES/VDI functions for the best result, no LineA.
Yes, Work_Out(13) should works on all graphics cards and Work_Out(0)
and Work_Out(1) for X and Y screen resolution.

Bye

Java was originally developed by Sun as a language for reliably programming consumer devices. It is based on C++ but has automatic garbage collection and no pointers to increase the robustness and reliability of programs.

Java programs are compiled into bytecode. Bytecode is not native code to any particular machine architecture, rather it is native to a Virtual Machine (VM). In order to run a java program you need a VM for your (real) machine.

Sun realised that java could be adapted to distribute software over the internet. You would only need to compile a java program once and it would run on ANY machine that had a VM written for it. Hence the VM was first incorporated into Web browsers as a means of easily extending their capabilities. At present the java VM is only incorporated into two Web browsers - Netscape 2 and Hotjava.

As I understand it the VM can only be ported to 32bit systems. So if it were ported over to TOS based machines it would be limited to Falcons, TTs, Medusas, Pak030 etc.

In theory it is brilliant, because any program you write in java has a market of all the machines with a java VM. In practice the VM has only been ported to Intel, Unix and Mac machines. It is currently slow and buggy in my experience, but will undoubtedly improve with the introduction of things like just-in-time-compilers that compile bytecode into native machine code on the fly.

Sun wants java to be an open system, so language specifications and source code are freely available. I don't know about the source code to write the java compiler or VM though. In theory, if the VM could be ported to a 32bit TOS machine we would have access to a wealth of software.

> Is html authoring classed as programming?

No. I don't want to get into a theoretical discussion on what consitutes a programming language, but I would suggest a true programming language

needs logical and mathematical functions and control over data and
execution flow. Html possesses non of these.

Hope this helps,

Michael

Well, Sun is working on a java chip. It is supposed to run Byte code
directly.

> As I understand it the VM can only be ported to 32bit systems. So if

Oh! The 68k is a 32 Bit processor. Guess, why sinclair once sold their
68008 Machine as a 32 bit Computer (with multiplexed 8 bit Data Bus).
the 68000 has a multiplexed 16 Bit Bus. That was one of Ataris,
Comodores and Apples Marketing Mistakes. they did not beat ther real 16
bit Machines by IBM with greater numbers. Just look at DEC, SUN, or SGI.
They now are proud of presenting 64bit Machines. so they are supposed to
make realy fast Computers. Just whatch a Alpha with byte operations. It
is really slow!!

on the other side Java does nor reqire a 32 bit machine. The Virtual
Machine is 32 bit. that doesn't say anything about the machine it is
implemented on. Theoretically a 1 bit machine would be enough (though
not sensible).

> Sun wants java to be an open system, so language specifications and

The sources of the JDK (Java Developer Kit) are freely available. You
just have to sign, that you don't distribute it in any way, because
Javasoft wants to have Control over it. As long as you don't make money
with it, Javasoft doesn't take any from you.

Christof

I'm thinking of the PC versions of GEM (including ViewMax) here, but
I'd hope the file format is sufficiently similar on the ST:

What is the format of the .ICN file (DESKLO.ICN/VIEWLO.ICN/VIEWHI.ICN etc)
which contains the Desktop icons?

Has anyone written a program, similar to that on the Sony Playstation music/graphics thingy? I know it would not have the 3D effects etc, but anything is better than nothing.

I once wrote a STOS program which strobed the screen with the music, reading from my Stereo Master sampler, but, as it was STOS, it was not very good. Ideally, I would like something that only reacted to the bass of the music.

I would have liked to write the STOS program in assembler, but I know sod all about the ST's screen addresses and how to clear the screen etc, although I can use assembler but don't have one for my STE.

Please e-mail any replys as I am on my Uni vacation just now and don't have much time for checking Usenet (it's a Uni account), and I will miss any postings (probably).

Thanks in advance,

Fraser.

Even I'm not going to disagree with you here. Awful as STOS is for most
of the purposes people put it to, I have to say this is one application
where STOS is ideal. Apart from the crap editor that is.

  Then your intentions and your postings don't seem to be on the same
line, to say "as it was stos, it was not very good" is a criticism of
the programming language, your intentions may have been different, but
what I read, is what I saw, is what I responded to :)

  STOS can be criticised for many things, it is not the greatest of
languages by any means, but if someone wants to say such, then they
should have tried it to its limits then said its not up to it,

>Also, it's not that I "could not do it", I did! I just wanted it to be

 c'mon! thats exactly what you implied, you may not it would now seem
have meant that, but I doubt anyone reading it would have read it any
different?,

>can be very powerful when utilised fully, but all I want is a simple,
>fast as possible program. Assembly seems the best choice for this.
>

>And what happened to a little courtesy? Most browsers have a button
>to send as mail and news, so is it too much to ask that you press
>that one instead?
>
 I did, I sent the posting as mail and news, I could not see any
reason not to include the posting in the newsgroup, it is a harmless
debate after all ?

 You have missed the point of my posting,

 1) hopefully the smileys and the lack of any animosoty or swearing
or nastyness or anything showed that this wasent exactly meant as a
personal attack, hence the public posting :)

 But let me explain why I responded?

 2) I use STOS (you guessed that already?), and I find there is very
little it cannot do, I am the keeper of the FAQ and have written
various articles on the subject for everything from diskmags to
national magazines (with the use of a spell checker),

  For many good reasons, people have an instant opinion of STOS and
believe it to be totally useless, this is brought upon in no small
part by people telling everyone it's ....useless, Your posting DID
make it look like you where blaming stos, you havent the extensions,
upgrades or even the compiler it now seems, to have enough experience
or knowledge to make this claim, sorry to labour the point, but you
cannot simply say "as it was stos it was not very good", you are
helping get the language a bad name by making such unfounded
statements,

  After all, what is "comp.sys.atari.programmer" for, if not to debate
such point's?

Cheers.....!ynoT

I wasn't criticising STOS as such. I don't have the compiler, so the load up time was about 2 minutes for a program that would probably take 30 lines of assembeler, and no matter how good STOS may be, assembly will always be faster than an interpreter based language (unless you have the compiler, which would have to be very efficient).

Also, it's not that I "could not do it", I did! I just wanted it to be better, and as I don't know much about good ways to convert an audio signal to a moving patern etc, I thought I would ask to see if anyone had done something similar. Do YOU know how to do it? Real time sound analysis is the the subject of degrees and is (probably) not easy, and STOS as an interpreter would probably not be any good (unless there is an extension for this).

> >I would have liked to write the STOS program in assembler, but I know

I meant clear the screen using assembly language. I thought that was
obvious in the question.

> >although I can use assembler but don't have one for my STE.
> >
> You have an STe...for crying out loud!, STOS is exactly what you
> want, DMA? no problemo, even more commands if you have a Falcon

What use is DMA in this application? Please tell me so I can use it.
I don't even think I have the extensions anyway. (looking at the last
sample player routine I used, it was the one you get with the sampler
package, so I probably don't have them). I never use STOS anymore anyway,
because my brain is already fried with languages such as assembely, C++,
scheme, eiffel, etc.

No I didn't. In no way did I say that STOS "isn't up to the job", it
can be very powerful when utilised fully, but all I want is a simple,
fast as possible program. Assembly seems the best choice for this.

And what happened to a little courtesy? Most browsers have a button
to send as mail and news, so is it too much to ask that you press
that one instead?

The Compendium says `While no direct TOS support is available for
reading these ports [the CX-40 style joystick controls], is is
possible ussing the IKBD contgroller in one of several joystick
reporting modes.'

It seems it's pretty complicated to read the joysticks in C. I hope
somebody else has already written something to do it, as it involves
writing to the IKBD chip. There is one mode of this chip in which it
translates all joystick position information into arrow keys.

Well, better late than never. I remembered I once saw such a routine
in Motorola's M6800 Microprocessor Programming Manual, and yesterday
I found it. It's 1975 vintage code, but what the heck! Mind you,
if it doesn't work, blame Mototola - not me.

Regards,
Tommy

Has anybody successfully sent an image to GemView 3 via Xacc ??

Everytime I try it I am greeted with 2 bombs and Gemview dies.
Receiving images from Gemview via XACC is not a problem and works
fine.

Is this a known problem with Gemview 3 or is it a bug at my end ??

Thanks in advance for any help..

I just got GFA with MAGE, I am using MagiCMac. GFA can be patched with A La Card, however, I have A La Card and it is not in English. I also got Button Basic and its disk was unreadable. I can not use MAGE because all the disks were unreadable, as was the Button Basic disk, and the NVDI 4 disk 2.
I really need any practicole info "you" have for setting up GFA Basic.

I am trying to write an atari device driver for a DOS serial mouse.
I have the USART setup so that it recognizes the mouse, however,
I don't have any documentation on what information the mouse
produces. What I need is the details of the mouse packet, i.e.
order of information, size of each piece of information and the
specific values for the mouse buttons. I have a 3 button mouse.

Thanks in advance.

Unfortunately, MagicMac cannot read ST formatted disks, only PC
formatted ones.

If you format some PC disks on the Mac (using PC exchange) and get
some kind soul with an Atari to copy MAGE on to the PC disks, you will
be able to install MAGE on your Mac (Whatever MAGE is !!!).

Hope this helps..

Steve.

summary: Asking how to make a virtual drive on the Atari ST

Does anyone know how to create a virtual drive on the ST , or , where I
can learn about it ?
From my point of view , that is a program that respond to a TOS disk
drive. It may get a message like "CD test" for example , or messages
dealing with data channels traffic.

Thanks for any answeres.

A program called <Pysgham2> can do this and more.
It can :
- create virtual drives like M: for C:\auto if you want,
- lock a partition to avoid programs to write on it.

You can find it in <ftp.cnam.fr/pub/Atari/Disk/pysgham2.zip>

Anyone out there able to write drivers for the Super Charger?

I'm in need of a simple midi driver for my Super Charger...
I'm assuming all that is needed is a driver for dos that

locates and enables the atari midi ports for dos applications to
use.

If you can do this...or know of one already in existance...please
reply to this post.

Also, note that many of the dos programs allow you to enter a hex
address for the midi port. Would entering the ST address for the
midi ports work on the Super Charger? Or would special drivers
be needed? If someone can tell me the hex address for the atari
midi out port...i'll give it a try.

Thanks,
Brian

Anyone know the HEX address for the midi ports on an Atari 1040 STe?

Thanks,
Brian

Hi! I'd like to know if anyone has ported the most recent version of

trn (3.6) to MiNT. I'd also like to hear from people who have compiled
trn on their own, regardless of version, just to see if this is
something that I could attempt with my limited skills.

Gustavo

There is a text file which explains how to use Joypads for STe/Falcon.

Go to: ftp://ftp.cnam.fr/pub/Atari/Programming
or /Atari/Falcon/Programming

But I don`t know how to use standard Joysticks
Bye.

I am over 18 and live on planet earth. - Where do you live ???

We once had a C220 but unfortunately I don't have any nude pictures
of it - do you have some ?

Whoever,

Why is this posted here in 'comp.sys.hp.hpux'? Please restrict your postings to the appropriate groups. I know of many women who work with HP-UX - they are an important and valued part of our community. This posting may offend them. It offends me.

Furthermore, this is advertising. Once again, this is not welcomed here.

Anyone can help me? I'm trying to load colour icons from external
resource. I don't want to include them in the main resource which
I load with rsrc_load, because it'd probably grow beyond 64k
and because the icons aren't always used. The problem is how
can I convert colour icons ob_spec field and the pointer info
to point to correct places in memory?
The colour icons ob_spec fields seem to be very strange. Unlike
other objects ob_spec fields, which include offsets to the
file, colour icons ob_spec field seem to contain order number.
For example the first icons ob_spec is 0, the seconds 1 etc.

I'm totally lost what I should do, any help appreciated!

Regards,
Arto Jalkanen

Those numbers are indices into the array of cicnblk (I think that's
the right name, I don't have my manuals here) structures which are
I believe immediately after the other arrays of structures.

I assume you have some documentation on how colour icons are stored
in memory once they're loaded? There's a linked list of other
structures, each with details of a version for a particular colour
depth, I imagine the resource file has a similarly complicated
layout.

As I and many others have said before, it's all in the Atari
Compendium.

Hi Everyone, it's me again. ;^)
```

After all the messing about with the different assembler syntaxes, I decided to go back to good ol' C to do the work, and then mess about with optimisations later.

Now, I think I nearly have it all down hat, except I'm unsure of how I should use the (void *) returned by Physbase(), and I'm not sure that I'm POKEing the color into the memory correctly with my PutPixel() rout.

If someone could modify this so that it works, and/or explain what I'm doing wrong, I'd be most appreciative.

Replies here appreciated, and e-mail really appreciated!

Also, if anyone's got some C routs for the Joystick / Joypad, I'd be most appreciative.

Many Thanks,

Karl.

P.S. Crap code follows.

>Recently I found out that GEMDOS.MAlloc(-1) does not return the free amount
>of memory but rather the largest free Block. Am I correct?
Yes.

>And if so, how can I find out the amount of free memory?
Do a series of Malloc(-1) until there is no memory left. The routines below
get largest available blocks of ST RAM, TT RAM as well as total memory:

```
unsigned long free_STmem, lblockST, lblockTT, free_TTmem;

free_STmem = GetFreeSTMem();      /* get free ST memory using Malloc(-1) */
free_TTmem = (rom_ver >= 0x200) ? GetFreeTTMem() : 0;
                                  /* get free TT memory using Mxalloc(-1) */

unsigned long GetFreeSTMem(void)  /* calculate free ST TPA memory */
```

```
{
  char *p[20];
  long *mem = NULL;
  char x = 0;
  short first = 0;

  free_STmem = lblockST = 0;
  if (rom_ver >= 0x200)           /* ROM version >= TOS 2.00 */
  {
    do                            /* make sure that get ST RAM only */
    {
      if (mem = Mxalloc(-1L, 0)); /* return largest block */
      {
        p[x++] = Mxalloc((size_t)mem, 0);  /* Mxalloc it out of the way */
        free_STmem += (unsigned long)mem;  /* add to total and do again */
        if (first == 0)
        {
          lblockST = free_STmem;  /* largest free block global */
          first = 1;
        }
      }
    } while (mem != NULL);        /* until no more blocks left */
  }
  else
  {
    do                            /* get ST RAM if Mxalloc not available */
    {
      if (mem = Malloc(-1));      /* return largest block */
      {
        p[x++] = Malloc((size_t)mem);     /* Malloc it out of the way */
        free_STmem += (unsigned long)mem; /* add to total and do again */
        if (first == 0)

Having written several programs like this, about all I can say, Nathan, is
your pages are too long. :)

One good book on parsing and recursive descent expression evaluation is
"Algorithms + Data Structures = Programs," Niklaus Wirth. It has two
advantages for you: It's probably in your local university library, and
it's written in Pascal. Since your using Pascal, that could help a lot!

Anyone know where I can find some info on the drag&drop protocol?

Some 'C' sources would be helpful. =)

It's for a friend with no net access, he has the Compendium but can't
seem to get it working from what the book says.

```
main()
{char    *p   =Physbase(),  /* ie any 32 bit declaration */
     *l   =Logbase();

 printf("Physical screen starts at 6\n",p);
```

```
 printf("Logical screen starts at 6\n",l);
}
```

The whys and wherefors of writing directly to screen memory are best decided by you but I would have thought you would be better off writing to the logical screen. By default, it points to the physical screen anyway but would make future enhancements easier?

Hello all,
     I want to be able to change my Falcon's screen resolution at bootup. I am using the function Setscreen (VsetScreen in Lattice C for the four variable version) and passing the pointer to the physical and logical screens plus other parameters. It seems to work if I run it after NVDI but not if run before or without NVDI. Any ideas?

It does also occur on a user-mode read, IIRC.

>I'm asking these questions as i don't have an ST with me at the moment.

Yea, guessed so....

Anthony

I'm writting an ST emulator and have a few questions on the 68000.

Does anybody know what LEA (An),An do ?? is it the same as MOVE.l An,An?
I know that LEA d16(An),An just copies the address An+d16 into An..

Also does ADD.W Dn,An etc. effect the top 16bits in An..?

Also, does a bus error occur when you only write to the first 2k of
memory, or does it also occure when you read there too in user mode.

I'm asking these questions as i don't have an ST with me at the moment.

Thanks.

Hullo Again ;^)

Can anyone tell me how to turn the mouse cursor on/off? I seem to remember
a long time ago that it involved messing about with a variable
at $4004 or something like that?

C code would be nice, or a pointer to a gnu header ...

Many thanks,

Karl.

I think so, but maybe the effect on the conditions codes is different.

>
> Also does ADD.W Dn,An etc. effect the top 16bits in An..?

adda.w / suba.w do sign extensions on the source operand.

>

I've tested this recently on my ST (only reading).
Reading from the first 2k is invalid.

hello,

I'm just a beginner, and tried to program in Lattice C. Simple C
programs that do not use GEM are no problem, but programming a window,
or connecting a rsc-file to a program written in C is something else.
Can somebody help me with this?

Greetings Saka

Yes, both are nop's, without any change to the condition codes.

|> Also does ADD.W Dn,An etc. effect the top 16bits in An..?

Yes, the lower 16 bits of Dn are sign-extended to 32 bits before
adding them to the 32 bits of An. But LEA (An,Dn.w),An is faster.

|> Also, does a bus error occur when you only write to the first 2k of

Both reading and writing.

Andreas.

I think that it is the same as MOVE, as far as the result is concerned.

:
: Also does ADD.W Dn,An etc. effect the top 16bits in An..?
'An' is always treated as a 32bit value when written to. So in your example,

ADD will add a 16bit Dn value to a 32bit An value.

:
: Also, does a bus error occur when you only write to the first 2k of

The STOS users' magazine desperately requires contributions in the shape of articles, letters, messages, suggestions, programs, etc. in order to survive. The editor, Deano, has informed me that he has very few articles for the next issue of STOSSER, let alone the long term future of the long running disczine.

Any contribution will be warmly received and DOES NOT NEED to be STOS-related. Any Atari article is welcome. Note, there is no payment made, the magazine is non-profitmaking and is avilable as PD. Your views and news, contributions and source code, etc can be sent to me:

sinbad@airtime.co.uk

and I will pass them on to an eager Deano. Come on, put something back into the Atari scene!

Thanks in advance for any contribution made.

To find out more about STOSSER check the WWW page at:

http://www.airtime.co.uk/users/stosser/

or visit my homepage at

Any access to "supervisor" space whilst in "user" mode is trapped by
the MMU. Supervisor space also exists over the i/o area (offhand -
$ff8800 up?).

: program can (reasonably) join them together to make a larger block.

: The most portable way to do this is to use only the tools you are
: guaranteed to be provided with - Malloc() and Free(). Something along
: the lines of ...
I dunno what you mean by "portable", since Malloc and Free you usually
don't use for portability but rather malloc and free (lower case).
In application programs thats usually better anyway, because each Malloc
takes up a snippet of GEMDOS poolmemory, which AFAIK is pretty limited
(you extend it with FOLDR100.PRG) at least in older TOS versions.
And its really portable.
There is no malloc(-1L) or somesuch to discover how much free memory is
available on the other hand.

: All we've achieved is to find how much free memory there was at the
: time we checked - pretty useless except to provide a real time display
: of memory. There is *no* other purpose for doing it.
Hmm, thats a strong statement I wouldn't put my name under.

Portable in the sense they are documented system calls as opposed to
hacking into the system.

>In application programs thats usually better anyway, because each Malloc
>takes up a snippet of GEMDOS poolmemory, which AFAIK is pretty limited
>(you extend it with FOLDR100.PRG) at least in older TOS versions.

The MWC arena grabs something like 16Kb blocks and doles it out itself
to offset the TOS memory bug. Like you imply, this makes Malloc(-1L)
effectively useless as well.

>And its really portable.
>There is no malloc(-1L) or somesuch to discover how much free memory is
>available on the other hand.

It wouldn't be possible to provide a standard malloc(-1) because that
would imply the operating system is capable of "locking" the memory
management system between the n=malloc(-1) and malloc(n) calls. If the
OS could not do this then it would render the malloc(-1) useless in
the same way as Malloc(-1L) nearly is for user purposes.

>: All we've achieved is to find how much free memory there was at the
>: time we checked - pretty useless except to provide a real time display
>: of memory. There is *no* other purpose for doing it.
>Hmm, thats a strong statement I wouldn't put my name under.

I think I went a little over the top there, yes. In fact I have
written a MagiC program which uses Malloc(-1L) for the sole purposes
of grabbing all *but* a specified amount of memory. I use it in

parallel with test programs to ensure they do not fail when memory is
suddenly in short supply or non existent.

"d16" gets sign extended to 32 bits, and then added to An.

> Also does ADD.W Dn,An etc. effect the top 16bits in An..?

The value in Dn is sign extended from 16- to 32-bits, and then added to
the 32-bits of An.

Both reads and writes are affected. But this is controlled by thr Atari
MMU chip, not the "in CPU" MMU in '030+ processrs

: NVDI but not if run before or without NVDI. Any ideas?

:-) I have written one of these as well - damned usefull when your machine boots up in bloody low res on a VGA monitor...

I have mine working fully - it's about 3rd in my AUTO folder (a program to turn the speaker off, then FPATCH or something like that before it). It definitely works without NVDI coz I haven't got NVDI.

You say you are passing the pointers to the logical and physical screens? I don't think you want to do that - just pass -1.L for those and let the OS sort it all out (it will reallocate the screen to be the correct size for the resolution you want and reinitialise the VDI).

I'll fish out my source code later on, so if you have any more problems, just let me know.

Cheers,

Hello all,

Recently I bought a GFA Basic version 3.6 (TT compatible).
Now I have had the unpleasant experience that the interpreter crashed
several times, with two bombs. there is no prior warning, nor does it
seem to occur at any specific point in the programs I'm trying to run.

Anyone had this same experience and knows what causes it ?

You should be able to find some source code examples around. Sometimes people include the source code with their PD offerings, otherwise there are a few books that show how to use Gem more or less properly.

But chopping and changing someone elses code is a reasonable way to start.

I based the design of my font editor Fonty on the examples in Compute!'s ST Application Guide Programming in C, which is full of errors and ommissions, including being aimed at a compiler called Alycon C that I have never come across, but gave me a framework to build a proper fully functioning desirable program with. The breaking the different Gem tasks into different modules made the whole design of the program easy to maintain and adapt.

Tim Oren's Gem Class is available on most ST PD libraries and is not too bad.

I have that version of GFA-Basic (3.6 TT) and one thing you do _not_
want to do is set the fast load bit to on. The interpreter does not
like that. I also had problems with it when ExtenDOS was loaded and
that is easily solved by not booting up the ExtenDOS. Newer versions
of ExtenDOS may not cause this.

Hope this helps...

Isn't that a little ... permanent? I just want to write a little auto folder program that can set the screen resolution properly prior to running (for instance) a shell program. the default resolution with a VGA monitor isn't suitable.

Hmmm. In my experience, windows are the easy part of GEM programming

and dialogs come next. Programming a simple frame to handle window events will teach you the basics of event-based programming, then adding a menu looks like the next step, as this already involves creating a RSC file. Designing a menu with an RCS is quite simple, dialogs is a step further IMHO.

In any case, get `Profesional GEM' by Tim Oren. It's a public domain TeX book about GEM programming, and though a bit outdated by the advent of modern callback libraries and new options in the newer AESes, it's still a good start.

Regards,

There are a number of little programs that allow you to set your NV-Ram.
eg. Bootconf (I think this is the one that I used...)

ftp://ftp.cnam.fr/pub/Atari/Falcon/Utilities/btcnf120.zip

You can say whether you want double-line on/off, number of columns, and
the number of colours, of the initial resolution.

Dont touch the HD stuff, unless you know what you are doing...

Not for 2 bombs, but sometimes (with v 3.5) it crashes - writes whatever he wants but not what i say - with long programs & many unused variables. May be the same thing?

I'm not using it for long programs since that, and i've no more problems (on a Falcon30)

Hope it helps,

hehe, we're proabably going to end up having to agree to differ on
this one 'cos your reason for starting with windows is my reason for
not doing so, namely events! :-)

Anything asynchronous is a nightmare to debug. Couple this with the
modern trend of putting dialogues into windows (and thus a form_do()
replacement) then a thorough understanding of the object tree is a
must.

Hi, I'm trying to write a fairly large program in GCC, and could do
with some answers to these questions... My GCC version is 2.6.? IIRC
and runs under MiNT/MultiTOS on my 4mb Falcon.

1) is it possible with GCC to have part of the code using an FPU
   (on TT/Falcon), while another part uses software emulation?
2) How do you use inline assembler?
   I have a short (20/30 lines) assembler routine which I want to
   use, but cannot get it to use it.
3) Has anyone compiled EGEM for GCC?

Cheers

Anthony

Yes on 3, but I have not tested it fully.
Used an STFM (4 Mbyte) & GCC 2.5.8

Hi,

I'm trying to do some FORTRAN programming and find that source that happily compiles on WATFOR causes all sorts of syntax error reports when I try and compile it using BC-FORTRAN77. Things like "IMPLICIT NONE" don't seem to be recognized and generate an error. Maybe I'm missing something in the setup of BC-FORTRAN but I can't imagine what?

Does anyone have any experience successfully using BC-FORTRAN compiler 1.3c by Andre Kostli. Does it use a different standard than WATFOR or have some differences in syntax? Does anyone know of another FORTRAN for the ATARI, pd or commercial that might work better.

I'm not slamming BC-FOR at all and really appreciate the efforts of all involved in its' distribution but I'm really currious as to why I'm having problems compiling stuff on it, which don't occur with WATCOM.

Any help on this would be appreciated.

Thank's
Rob

I have been trying, with no luck, to use evnt_multi for getting clicks

from either the left or the right button.

I want evnt_multi to return when the user clicks the left button, or when the user clicks the right button, or when the user clicks both buttons.

I followed the method described in the compendium, but this did not seem to work. Also, the compendium does not explain what value to pass for state, it merely says that you must OR a value of 0x100 with the mask parameter, making the mask parameter 0x103.

I tried a number of values for state, including 0x01, 0x02, 0x03 and all of the above ORed with 0x100. These all worked in different ways, but none of them had the desired effect. It would either respond to only the left button, or only the right button, or in some cases none at all!

I am interested to hear from anyone who has got this working - explain what you did.

I am using AES 4 with MiNT 1.12.

Thanks for any suggestions.

What the 0x100 means is to negate the state requirement.

If you are waiting for either key, you are waiting for the state to
be anything other than zero, so it's 0x00 you want.

The explanation in the compendium was dreadfully unclear, even worse than
the Genie posting by someone in atari developer support that I assume it
was based on.

There is a solution quite simple.

```
     replace  event_multi(MU..., x, x, x,....)
     by   event_multi(MU...,130, 3, 0,....)

     - add 128 to ev_mbclicks
     - set ev_mbmask to 3
     - set ev_mbstate to 0
```

Then, you'll have an event for right clic OR left clic.
(check ev_mmbutton).

This method works with all tos versions exept 1.0.
It was originaly a bug, which has not been corrected to allow people
to keep on using it. It also works with Magic.

Prospero software will still flog you Prospero FORTRAN for GEM. You
won't get much by way of support though. Still, it comes with two huge manuals
on the A.E.S. and V.D.I. It took me through two physics degrees, analysed CERN
data, plotted solition waves, the lot. It only complained once when I tried to
do something really disgusting with EQUIVALANCE statements. Whad'ya wanna be
messing round with IMPLICIT NONE for anyway ? Seriously, I gave some PC-owning
"friends" a copy of BC-FOR, and so long as they kept it simple, they were able
to compile some simple numerical examples. Oh, the one thing PROFOR dosen't have
is a resource compiler. Bring a copy of WERCS. (Or better...)

Anyway, you can reach Prospero at:

Prospero Software,
190 castelnau,
London,
SW13 9DH,
England.

Well I'be been through most of Tim's tutorial and it is a good starting
point. But where do you get the info on the modern callback libraries
and the new AES stuff? BTW I have been using eXtended Sozobon C, if this
makes a difference.

Shure: G++

try

ftp://ftp.tu-clausthal.de/pub/atari/gnu/gcc

there should be g++ in one of the dirs.

I suppose the compendium is the best place to start but you still need
to hunt round for the extras.

Out of interest, whatever happen to GNU FORTRAN ? I heard it was going
to be compatible with FORTRAN 90. I know f2c (turns FORTRAN into C) has been
around on the ST for quite a while, have there been any developments ?

Have fun,
"Augeas"

I could never have worked that out by reading the compendium!

So, I pass 0x103 for mask and 0 for state, I will try this out.

Also, does this work on all AES versions or only newer ones? If so, how new?

Thanks very much!

Well, I tried both methods suggested, and none of them worked!

However, I did get it working in the end, by using 0x102 , 0x03 , 0x00
for clicks, mask and state.

Thanks to everyone who replied.

No, I couldn't remember which one you had to add 0x100 to so I deliberately
didn't say :) Phillipe said correctly that it's the number of clicks you
need to add it to.

I made a TERRIBLE mistake when I wrote that las year.
it is not 128+number of waited clicks but 256+waited clicks.
It's when I looked at my routs at home that I find the problem and I
couldn't answer you before.

I beg your pardon for this.

Hi, I have a Copy of Tom Hudson's Cad3D.v2 for the Atari
but my copy of hardcopy.prg produces defective Gem files
- the files seem to be truncated, and the metafile extents are
not updated.

The original disk does not boot correctly, and all by backups
have the same problem, so the problem may have existed when
I got the original disk. At the time I used the printer driver,

but now I need Gem files so as I can covnvert to Postscript.

Do you have a version of hardcopy.prg, hardcopy.rsc that uou can
uuencode and send me ? I know this is commercial software, but
harcopy is useless if you don't already have Cad3D.

cheers

Hi

I'm currently writing a large GEM based program. One of the things
that I need to do is detect the user clicking and dragging an object.
The object is just a few lines (drawn with the VDI). How do I detect
this with evnt_multi()? I need to be able to distinguish a single
click from a click/drag ...

Oh, I'm writing in C on a Falcon (MultiTOS compatable)...

Cheers

Anthony
(someone with no GEM-docs. Only bits of source, and tutorials...)

You might like to use/adapt the following for evnt_multi(). Nothing special but it makes it less prone to silly crashes and gives it some reasonable defaults if you fail to set it up.

```
typedef struct     {
int  evm_event;    /* required events */
int  evm_clicks;   /* required number of clicks (usually 1) */
int  evm_button;   /* required button (1==left,2==right) */
int  evm_bstate;   /* required state (0==up,1==down) */
int  evm_m1io; /* 0 == into, 1 == outof, (default into) */
Rect evm_m1;       /* default, all set to 1 */
int  evm_m2io; /* default outof */
Rect evm_m2;       /* default, all set to 1 */
int  *evm_msg;
ulong    evm_time;
int  evm_mousex;
int  evm_mousey;
int  evm_mbutton;
int  evm_kstate;
int  evm_keycode;
int  evm_clicked;
}    EVM;

int
```

```
Evnt_Multi(m,init_flg,msgbuf)
EVM  *m;
bool init_flg;
int  *msgbuf;
{
 if (init_flg)     {
     m->evm_event = MU_MESAG;
     m->evm_clicks = 2;
     m->evm_button = 1;
     m->evm_bstate = 3;
     m->evm_m1io = 0;
     m->evm_m1.x = m->evm_m1.y = m->evm_m1.w = m->evm_m1.h = 1;
     m->evm_m2io = 1;
     m->evm_m2.x = m->evm_m2.y = m->evm_m2.w = m->evm_m2.h = 1;
     m->evm_msg = msgbuf;
     m->evm_time = 0;

     return 0;
 }

 if (m->evm_msg == NULL)    {
     form_alert(1,"[3][Evnt_Multi()|Not initialised][Fatal]");
     return 0;
 }

 return evnt_multi(
         m->evm_event,
         m->evm_clicks, m->evm_button, m->evm_bstate,
         m->evm_m1io, m->evm_m1, m->evm_m2io, m->evm_m2,
         m->evm_msg,
         (uint)(m->evm_time & 0xffff), (uint)(m->evm_time >> 16),
         &m->evm_mousex, &m->evm_mousey, &m->evm_mbutton,
         &m->evm_kstate, &m->evm_keycode,
         &m->evm_clicked
         )
 ;
}

to use simply ...

EVM evm;
int mas[8];

main()
{
 /* initialise */
 Evnt_Multi(&evm,TRUE,msg);

 /* main loop */
 for (;;){
     events = Evnt_Multi(&evm,FALSE);
     if (events & MU_...)   blah.
 }
```

}

In your case you need to be looking for button events so mask in MU_BUTTON events (evm.evm_event |= MU_BUTTON) - the rest of the defaults set above will do the job as they are (and do double clicks - change evm.evm_clicks to 1 if you dont want these). When you get the MU_BUTTON event, evm.evm_mousex and evm.evm_mousey will contain the mouse position when the event occurred, and evm.evm_mbutton holds the button state at that time. evm.evm_kstate is also valid in case you want to make use of shift etc.

At this point you obviously need to ascertain if the mouse was within your "object" and act accordingly. Assuming it is ...

If you were displaying an OBJECT tree things would be a little easier because you could use graf_dragbox(). You could of course generate a dummy OBJECT then call graf_dragbox(). Note that this and other similar aes routines terminate immediately if the left mouse button is not down when they are called.

You may want to drag the object in such a way as the object itself moves rather than having an outline. Try graf_mkstate() which tracks the mouse in real time and blit the object accordingly. As soon as your routine via graf_mkstate() detects the mouse button is up then the object should be dropped.

That's about it without some specifics! :-)

newsgroups: comp.sys.atari.programmer

Hi

Does anybody know why copying folders from one minix partition to another (using 'CP') works differently when the commands are typed individually as opposed to using them in a batch file?

I recently had to copy several folders from one disk to another. I wanted to select the folders to be copied (about 35) from a disk with 90 folders total.

Because the desktop has problems with long filenames, I was resigned to typing CP -dvR (source) (dest) for each folder.

I tried to save time by creating a list of wanted folders & edited this to make a batch file with all of the filenames & parameters. This appeared to run ok, but after it was finished, none of the folders were present on the destination disk.

The destination disk was also full of errors (I used fsck).

When I 'CP'ed all the folders (typed in the names) everything was ok.

Is this a problem with mintshel or is it some problem with Minix.

Maybe the minix daemon was prevented from running by the amount af data being transfered (approx 90 Mbytes).

Also, I use Tapebios (magnetic tape driver) with Gtar (special version of tar which works with Tapebios) to backup files. Using Tapebios, I can do image backups or TAR backups with no problems on TOS partitions (up to 250 Mbyte no problem so far).

I can do image backups on Minix partitions also, but for some reason Gtar crashes when I try to tar more than 50-70 mbytes from a Minix partition.

I have an idea that MiNT is causing the crash, I am using freeMiNT 112.5. It also crashed under older MiNT versions.

Anybody seen this before.

I think MagiC docs can be obtained from one of the german ftp sites
though I don't know where. The Compendium would be a good source for
modern documentation - it is also available on cdrom now as well.

I believe Pacman was invented by the japanese company Namco first for
the arcades and later licensed by Atari for the VCS console.
So you will have to ask Namco about it... they should be on the web
somewhere.

Bye,

I'm not sure, probably Atari Games/Tengen/Warner.

haven't written draggable-item code in yonks, but here is a sample
algorithm that should work:

```
Call event_multi
  if event is a click  (MU_BUTTON)
    if button is still down (vq_mouse)
      change mouse to "drag" shape (graf_mouse)
      wait for mouse button to be released (vq_mouse)
      do appropriate "item has been dragged" processing
      show "on-screen item has been dragged"
      change mouse back to arrow (graf_mouse)
    end if
  end if
rest of processing ...
```

Pacman was first introduced by ATARI corporations game division.
Warner Brothers owned Atari at that time, and still owns the Atari
game division and all rights to the Pacman game.

The original game was the coin arcade machine (around 1979). Later,
Atari's computer

division sold the home version (around 1982). This was before the sale to
of
Atari computer division to Jack Trameil, who was CEO of Commodore
computers.

Hope this helps
Evan

```

Is it really a good idea to mix AES & VDI calls like this? You could use graf_mkstate(), or even another evnt_multi() (with a short timer) instead...

```
>       change mouse to "drag" shape (graf_mouse)
>       wait for mouse button to be released (vq_mouse)
                                             ^^^^^^^^^^^
```

See above...

```
>       do appropriate "item has been dragged" processing
>       show "on-screen item has been dragged"
>       change mouse back to arrow (graf_mouse)
>     end if
>   end if
> rest of processing ...
```

Also, a wind_update() would also be a good idea.

>Do you have a version of hardcopy.prg, hardcopy.rsc that uou can
...

Thanks for the offers of Hardcopy; I now have one that works better than
mine, though it still does not write in the Metafile extents.

When I put these in by hand, Timeworks publisher V2 is happy with the Gem files
and I can produce postscript from Timeworks - small thing print fine
large things take forever to print, though Ghostscript is quite quick
to produce images, even on the ST.

mfps still won't accept the Gem files - it starts to produce a
postscript file from the Gem, then crashes.

So, my next question is " does any one know the file formats for :

Cad3D.v2 .3d2 files,
Cad3d.v2 .SIF (sequential image) files
GEM header (first 20 or so integers)

In the Gem header I have deduced that integers [5,6,7,8]
(counting from 1) are the Metafile lower,upper limits.

For the output of Hardcopy I set (16 bit integers)[7,8] to be 20479 32767.
(or in bytes : [13 to 16] set to be 255 79 255 127).

This nicely fills the box in Timeworks when loading the image.

Thanks for the (4) offers,

cheers
     beau webber

Just check if the button is still down after evnt_multi returns.
If it is, then you know the user is still holding the button down, and
therefore dragging.

After 9 years ownership of an ST at last I am trying to write a
GEM application in C. Now all this effort would make more sense
if I could convert GEM applications I write to the PC. But I have
been unable to find ANY mention of GEM in any of the PC archives
I have searched.

What I am looking for is a PD GEM library for the PC. Can anyone help
please, I would be willing to buy a commercial version if someone
has one for sale.

It's a pity Digital Research did so little with GEM, it had the main
features of Windows without the 'bloat'. Windows 95 has just got the
grow-boxes and folders of GEM some 10 years late. How did DR
manage not to make a success of it ? :-(

Thanks
Mike

Hi,

I am trying yo get in touch with Olaf Meisiek the author of the excellent resource editor Interface.

I am using the Mydials resource extension routines in OASIS 2 and can't use the 3D options because the GFA Basic version of the Mydials software was compiled in such a way that I can't send the 3D on/off flag when Mydials is initialised.

If yopu are reading this Olaf, or someone knows how I can get in contact with him PLEASE e-mail me.

Thanks in advance.

I'm not sure about on-line documentation, but you might like to consider the
book "The Atari Compendium". It's about 40 pounds sterling available from
HiSoft (and loads of otherp laces I'm sure). It's very complete, covering
MiNT, MultiTOS, etc all the way up to TOS 5 (although I haven't found any
system calls etc that are TOS 5 only...)

Cheers,

James Cox

Hi!
I need a assembler source for multiplying two 8 bit unsigned
numbers on a 6800 motorola, but any source for any 8-bit
processor would help. It has to work by shifting and adding,
not simply by adding. The result should be a 16-bit unsigned.
Tnx in advance,
Christian

I'd shy away from the evnt library funcs, as they can cause a task switch to occur. But in my experience, the time it takes from evnt_multi returning, through to the above vq_mouse call is generally long enough so that if the user has moved the mouse, or released the button, it'd be apparent from the vq_mouse call.

To get the system VDI handle, one could call graf_handle early on, and use it with vq_mouse and so forth.

If one needs to alter any system VDI attributes, one can always use vq_extnd, change the attrib using vs?_xxxx, then do whatever, and restore using vs?_xxxx.

> Also, a wind_update() would also be a good idea.

True. Most of my code has been dialogs in windows and so forth, so the windowing library I wrote aeons ago has been used - it already did wind_update and mouse positioning code etc. It's not bulletproof (nothing is, despite what the marketeers say), but it works, and I haven't had a "it killed my data" support call yet that could be traced to it.

(In my library, each window got a separate VDI handle of it's own as well, so I used that in the above algorithm).

Hi Peeps :)

Does anyone have any information regarding java, rather then send me to a web page, can anyone give me a quick easy to follow rundown on what it actualy is, and any realtive atari software?

Is html authoring classed as programming?

There are html newsgroups, but making html pasges for an ATARI browser is a little different :), would this be the place to discuss it? that's presuming we feel it comes under "programming" ???

Cheers.....!ynoT

JAVA is a programming language that feels a bit like C.
It is primarily used for writing scripts into HTML code, but compilers
for it are appearing on the PC...

As yet, I do not know of any compilers available for the atari, or any
atari-browser that supports JAVA code.

All one can assume is that "TOS 5" is essentially MultiTOS with AES 4.1.
Nothing newer than AES 4.1 seems to appear in the book.

I haven't seen any refs in the 1000-odd page Compendium (April 1994 ed.)

to TOS 5.0 explicitly

I want to make a program in Gnu C/C++ on my Atari, which I can later port easy to other operating systems. Can anybody tell me where I can find documentation and sourcecodes of graphic function like finding screen adress, screen size, draw lines, put boxes, make windows.
I have termcap and curses docs, but I must admit it looks a bit strange for me!

E-mail to caschwan@stud.ee.ethz.ch, I don't have much time to look on the newsgroups.

>   Tnx in advance,
>   Christian

This sounds a lot like a job you have to do for school. I'll hint
you. This is ANSI C-code for a shift+add multiplication:

```
int mul(int x, int y)
{
     int i, res;   /* Reserve two variables */

     res = 0;  /* Temporary result */
     for (i=0; i<8; i++) {  /* Loop 8 times */
          if (x & 128)  /* Is bit 7 set? */
               res = res + y;     /* Yep, add */
          res = res << 1;        /* Shift left (multiply by 2) */
          x = x << 1;   /* Shift left */
     }

     return res;   /* Here we have the result */
}
```

What remains is to convert this to assembly, and if you know anything about that, it should be easy.

If you want the routine because you need a fast multiply, I can only recommend doing a tablebased implementation. Some base themselves on the fact that log(a*b)=log(a)+log(b), while others split the operands into chunks of say 4 bits to reduce the size of the table.

Greets,

Asger Alstrup

The latter functions are _very_ machine dependent so it would be wise to group them into modules. For each machine you want to support, you need a new implementation of the module. The header file, however, should be the same for all machine dependent modules.

I programmed a graphics device interface (GDI) some years ago, which was solely responsible for the screen memory access. Thus toggling pixels on and off, querying pixels, etc., was managed by the machine-dependent GDI, while the drawing stuff (Bresenham lines/circles, Beziers) was left to machine-independent modules.

I'll have a look into my dusted disk boxes and see if I can recover the stuff for you.

> I have termcap and curses docs, but I must admit it looks a bit strange

Termcap and curses are OK for character-oriented I/O; from the above I gather that you want to program pixel-based applications.

I have just acquired and installed SpeedoGDOS 5.0c and I am trying to write a few small programs using it.
I am in trouble outputting to my Epson Stylus 820, for which I use a Speedo driver that Epson France is providing. The problem is as follows:
 - I open correctly a printer workstation (returned parameters are OK).
 - I load the fonts.
 - I obtain the correct index 5043 for the font American Garamond (for example).
 - Then, vst_font() refuses to select this font, returning a value of 32760.
 - Of course no text output can be obtained after that.

Can anybody help me trace the problem? Thanks.

Roland Prajoux

PS: the same program works perfectly when outputting to the screen.

If any one is interested, I have written a program to generate
postscript from the Gem files produced by hardcopy.prg for Cad3D
sequential image files.

You see the problem was that hardcopy produces shading by defining
a new fill pattern for each polygon - Ghostscript previews this
no problem - just a few minutes on the ST even for a 40KByte Gem file,
but an Apple Laserwriter was spending hours to produce a picture.

I have written a short Apl program that reads the Gem file and produces
a postscript file that uses greyscale half toning (it just counts the
dots in the fill pattern). The same picture prints in 30 seconds.

If you have an interest in the program, I will translate it to C.

cheers,
     beau webber

Does the PS mean that you're getting the proper value (the font index 5043) from the vst_font call in the case of a screen workstation ? That almost certainly points the finger on the printer driver, as the vst_call is redirected by GDOS directly to the printer driver. Maybe the driver provides some not by Atari or DR specified error code, or perhaps it`s just buggy. Try a different font as well, maybe the printer driver looks for some specific stuff in the font the screen driver is not interested in. If it's the same for all fonts blame EPSON. Since they're eager to provide a printer driver for Ataris (which is rather astonishing for the computer world nowadays) they might even allow you to speak to the people who developed the driver.

Cheers Peter

: Does anyone have any information regarding java, rather then send me
: to a web page, can anyone give me a quick easy to follow rundown on
: what it actualy is, and any realtive atari software?

As has already been said, Java is a programming language intended for making programs that can run on any web page. The Java Developer Kit can be obtained free of charge from Sun Microsystems, but it does currently only exist for Windows NT/95, MAC and Solaris.

I don't think anybody is working on a porting to the ST. There is also no web browser for the Atari that supports Java applets.

OK, I'll take a shot at this.....

You can think of lightweight processes as 'subprocesses'. Imagine
that you implement your own threads package, each thread will then
be a lightweight process inside the common OS process assigned to the
package.

Hope this helps.

/HUGO.

 ok cheers, I presume the questions been asked before then?, well I
may not be using my Atari for net Access, but as my pages are only of
use to Atarians then its not worth looking into any furthur,
 Althoug if things take there proper course then maybe in the future
we will have a browser that supports such things ?, well heres
hopeing:)

 Thanks for the feedback :)

>/HUGO.

Imagine the following analogon:

    A lightweight process (or a thread) is to a process
    as o process is to the computer

within processes, multiple *threads* of control can exists (hence the name)
they share the same adress space and the same recources. The can comincate
to each other using this shared adress space and mutexes and condition variables.
(Look at some document for Inter Process Communication for more information
about these things).

You can implement a user thread package, or have kernel support for threads (Like Solaris).

When programming such packages you see typical calls like:

```
thread_create( procedure_name, variables, stack_size, &tid );

thread_destroy( tid );

thread_yield();
```

The last one is to voluntarily give op the CPU (used in non-preemted thread packages).

Hope this helps.

Hi, I am a GFA programmer, and I'm trying to detect a keypress without using the keyboard buffer. I am sure that I have done it before (years ago) but I can't seem to get it to work now. All I want to do is be able to detect if a key is up or down at any time! Is there a BIOS command that can do this or something? Anyhelp would be much appreciated. Thanks
.

>the value of WM_ICONIFY!!!!
>
     #define WM_ICONIFY 26
     #define WM_UNICONIFY 27

     These values are the values for iconifying and uniconifying a window.
The rest of the parameters passed are the size of the window to make when
iconifying or uniconifying.

     eg.: wind_set (wind_handle,WM_UNICONIFY,x,y,w,h)

x,y,w,h = dimensions of the uniconified window.

Hope this helps.

Right, I have a program that I know works on the p.c's and on the st will
compile perfectly fine. The problem comes when the object code is being linked
using the pml floating point math library.
While it is linking I get the messages as follows.
Double def of _infinity def: in _normdf.o libc.a
Type T, in xerror.o libm.a Type T
undef _raise from xerror.o libm.a

Does anybody have any ideas? If it's of any help I'm using the make utility
make.ttp because there are 9 files to link together.

Oh well. If anybody can help me I'd be most greatfull.
Daniel.

Combining the value of the _VDO cookie and the return value of Getrez():

```
    _VDO    Getrez
    0/1/2      2   => Hi res.  640*480
      2        6   => Hi res. 1280*960
```

> Also I don't think that XBIOS.Getrez() is of any help, because the XBIOS
> can't be aware of graphic cards.

No problem, if you check the _VDO cookie first.

>which supports a 640x400 monochrome mode? I just wondered if there is any
>safer way to do this?
Here are some useful parameters provided by the VDI:

```
short handle;
static short work_in[11] = {1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2};
                                            /* v_opnvwk input array */
static short work_out[57];                  /* v_opnvwk output array */
static short screen_lines, aspect_ratio, font_ratio;
long screen_width, screen_height;
short planes, colours, palette_size;
short rows, columns, table, backgroundcolours;
static short wchar, hchar, wbox, hbox;      /* graf_handle parameters */

handle = (short)graf_handle(&wchar, &hchar, &wbox, &hbox);
                                            /* find VDI handle */
v_opnvwk(work_in, &handle, work_out);       /* open workstation */
screen_lines = (work_out[1] + 1) / hchar;
screen_width = (long)work_out[0] + 1;
screen_height = (long)work_out[1] + 1;
aspect_ratio = work_out[4] / work_out[3];
font_ratio = hchar / wchar;
colours = work_out[13];
palette_size = work_out[39];
vq_chcells(handle, &rows, &columns);
vq_extnd(handle, 1, work_out);
backgroundcolours = work_out[1];
planes = work_out[4];
table = work_out[5];
```

>Also I don't think that XBIOS.Getrez() is of any help, because the XBIOS
>can't be aware of graphic cards.
Do not use GetRez, it isn't compatible and the result doesn't mean anything
on machines with graphic cards, overscan etc.

I recently acquired an Atari Portfolio and thought I might write some software for it. From the Portfolio FAQ I learned that this nifty little palm-top computer is mostly MS-DOS 2.1 compatible except for some differences in the serial port address & IRQ mechanism. However, the FAQ doesn't really explain what exactly those differences are. The only information it gives is a reference to a $60 book from Atari that I'm sure is long out of print....

Does anyone have a pointer to some Portfolio serial port programming info? Specifically, I'm interested in what is different about the port itself and the interrupt mechanism for writing interrupt-driven communication applications.

Thanks!

Hi, I started a program in GFA one month ago.
The program is a drawing program, but not like the others.
Actually, it would be a new way to draw with the mouse, I did the first
step, just to see if it would be worthy, and I think it is.
The program would be a simple program, just like you draw with a pen.
And the second step of the drawing is the colour. I think the user could
use an other program for the colours, because there is a lot of good
program for the colour.
I think the important thing in a picture is, in first, the lines, the way
they are together, and after you add the colour.
So, in short. I have a very preliminary prg, and I would like , if
someone interested, share that, and my ideas about this Prg.
Bye...

Would anyone have any starter code for FIDO door BBS games in either GFA
Basic or Hi-Soft Basic ???

I run a Ratsoft BBS and am using a USR Courier in Modem Port 2
and currently can not find any BBS games that will recognize that port.

So my solution is to right my own. Or modify current games to use all ports available. I have no clue as to how I could modify the port code so unless I get help..... well .....

Thanks in Advance for any help.

From: gmiller@inca.co.nz (Gaven Miller)
Subject: Lattice C object code (bug?)
Date: 1996/04/27
Message-ID: <4lt1p0$51d@inca01.inca.co.nz>#1/1
X-Deja-AN: 151852392
organization: INCA
newsgroups: comp.sys.atari.programmer

I have just come across a most unusual bug in the object code that Lattice C 5.6 produces.

In one of my header files I have a prototype defined as

```
     __stdargs uint16 TSRLibInfo( uint16 num, LibInfo *liptr );
```

Where "uint16" means "unsigned integer of 16-bit size", and LibInfo is a structure defined earlier in the header file. __stdargs tells Lattice to put all args on the stack, as opposed to registerising the first two.

When calling the function,

```
     rv1 = TSRLibInfo( 0, &li1 );     /* li1 is of type "LibInfo" */
     rv2 = TSRLibInfo( 6, &li2 );     /* li2 is another "LibInfo" */
```

Lattice C produces the following code:

```
     pea  li1(a6)
     clr.l    -(a7)
     jsr  _TSRLibInfo
     move.w   d0,rv1(a6)
     pea  li2(a6)
     pea  6.w
     jsr  _TSRLibInfo
     move.w   d0,rv2(a6)
     lea  $10(a7),a7
```

This has clearly increased the size of the first arg "num" from 16 to 32 bits. hence the function call (an assembler interface to an already resident app) is called with an incorrect pointer to "li1" and "li2".

The correct code should have had a "clr.w" instead of "clr.l", and

"move.w" instead of the "pea"

Casting the first parameter to "uint16" does not help.

The normal compiler opts I use are 32-bit integers, stack passing, '030 code.

The "Long Align Stack" option was not at fault, as I have never used that.

Sounds good!! I wonder how much bandwidth would be left on the Falcon bus to write a video decoder, to work alongside the audio decoder. MPEG 2 movies with sound here we come!!!... :-)

Surely if you use long ints (ie not the -w flag) then all parameters passed
to functions get converted to at least 32 bits before being passed. If you
want to pass 16 bit variables don't you have to specify short integers.

Page 196 of the 5.5 Lattice User Manual says
"The compiler generates code to extend each of the parameters to the size
of int if it is smaller and then push the parameters on the stack in
reverse order."

I rest my case.

>While it is linking I get the messages as follows.
>Double def of _infinity def: in _normdf.o libc.a

It just means that the var (or the function) called infinity has been
defined twice (once in libc, and once in normdf.o)

If you didn't write normdf.o check this two files using HAR3.PRG to
look the defined symbol in them and you'll see if infinity is really
defined twice.

A question :

If you are using pml lib, why do you have libm.a ? in the latest
version of sozobonX, this lib has bin replaced by pml.a

(chek in ftp.fu-berlin.de/programming/sozobon for the latest version
october 1995).
With it you normally didn't need libm.a anymore.

libm was called using -lm in makefile
pml is called using -f .... -lpml in makefile

>Type T, in xerror.o libm.a Type T
>undef _raise from xerror.o libm.a
raise is a function used by xerror.o (which is in libm.a)
I don't know about it. Try to see in which lib this function is
defined.
Maybe it is in libm but before xerror.o !!

The problem is that the linker normally check the libs once when
linking. And if a function is defined before another which use it, the
linker fail to solve its external call.
The solution : force the linker to make multiple pass (check ld
documentation to know how).

>Does anybody have any ideas? If it's of any help I'm using the make utility
>make.ttp because there are 9 files to link together.

Try this:

```
     movew    %3,a0@(a0:l:2)
```

Btw, newer version of GAS can also parse motorola syntax.

Hello, I'm working on a small soundproject for my
Falcon. I would like to playback sound using two
buffers so that I can process one while the other
one is playing. The problem is that I can't get
the interruptcall at 'end-of-buffer' to work.

Is there anyone who has some useful tips (or know
where to get example code) please email me.

Thanx in advance

a work around is something like this
__stdargs short TSRLibInfo(short,void *);
#pragma inline d0=TSRLibInfo((short),) {;}

int main(void)
{
     int  rv1,rv2;
     long li1,li2;

     rv1 = TSRLibInfo(0u,&li1);
     rv2 = TSRLibInfo(6u,&li2);
     return 0;
}
```

hallo leute,

zur abwechslung hier mal eine wirklich saubloede frage:

worin (ausser im cache und den schnelleren div(u,s) und mul(u,s)-befehlen) liegt
eigentlich die verbesserung des 68030 (der ja bekanntlich im Falcon 030 zu
finden ist) gegenueber dem 68000.

ich hab null unterlagen ueber den 68030 prozessor und hab mir deshalb ein programm
geschrieben, dass die taktzyklen pro befehl misst. auf dem 68000 misst es genau
die in
der literatur angegben werte, woraus ich folgere dass das prg korrekt arbeitet.
dumm ist
halt nur, dass so ziemlich saemtliche move-befehle mehr taktzyklen auf dem 030
brauchen
als auf dem 68000. DAS KANN DOCH WOHL NICHT SEIN. (die anderen hab ich dann gar
nicht
mehr getestet.)
ein atari st mit 16 mhz wuerde schneller "moven" als ein falcon (ohne cache).
ICH FASSE ES NICHT !!!
ist das jetzt die traurige wahrheit, oder hab ich doch irgendwo mist gebaut.
was gibt's denn ueberhaupt noch fuer neuerungen (gibt's da welche ?)

(falls jemand antwortet) danke im vorraus !!!

Ciao Jens

Encoding is many times more complex than decoding, so I haven't got any
plans for that atm. There's an encoder available (CCETT's ISO compliant
reference implementation) written i C, but it's very slow.
The DSP56k implementation of the decoder is about 30 times faster than
CCETT's implementation on the Falcon, and I wouldn't be surprised if
the encoder can be alot faster too :)

About 16kbit/sec are transferred to the DSP via the host port (depends
on the bitrate used) and about 90% DSP time is used, I guess the CPU
has to do the video decoding :)

Daniel,
I've had a fair bit of trouble using the pml with sozobonX. I get the impression that it hasn't properly been integrated with the rest of the sozX stuff.

I think that the library was taken from the GCC version and that some of the declarations in the routines are different to the ones in the sozX headers. I got hold of the pml source code and changed the offending declarations, then ammended the sozX pml.a with the new code (using ar) and copied the new version to a file called libm.a, which I link in the usual way.

The definition of infinity - basically a very large number, must be altered in the header to be consistent with the library routines (or vice versa). I think the errorno needs hacking too, and as for the actual routines.. my version has real problems with pow()...it requires log() and exp(), and unless these are called first in the code, they are not linked and pow() crashes..and even if it does work it fails on ln(10)...
The order in which the library routines are accessed can, I think be changed using the libsort program? not sure...anyone?

maybe I have an older version of sozX - if anyone has a version with a well-behaved mathlib, please point me too it!

Andrew.

Not a bug. An ANSI C implementation is permitted to perform the usual conversions (char to int, short to int, etc.) before passing the arguments.

[Article crossposted from comp.programming]
[Author was Steve Guidi]
[Posted on Thu, 2 May 1996 03:58:56 GMT]

Please, please somebody help me with this... I am working on a school project which basically asks a user to enter a mathematical formula and then the program will give the solution to that formula.

For example: if the formula is (R*S)/(R+S) where R and S are predefined values, the comptuer will calculate that using the values and give a solution.

The problem I have encountered is that the USER has to define this formula via an input/output routine. From my knowledge of datatypes, there is no type that will allow the computer to simply use the input as if it were a mathematical formula in the source code itself.

Taking the above formula used, the computer has to realize that R and S are variables in the formula and that the brackets and operateors are operators and not text.

Also, I have to develop this algorithm to use predefined functions such as SIN, SQRT, ABS, LOG, etc..

The formula can take any level of complexity also (there could be hundreds of brackets in there!)

I have consulted with a teacher at my school and he mentioned that the trick must lie with the way spreadsheet programs work. Say I were to enter a formula = A3 * A5 / ABS (SUM E2:E7), the spreadsheet program would work with that forumala with the values in the respective cells. This is VERY similar to what I have to do except I am lost and don't know how to do it!

I plan to use Think Pascal for Macintosh as I am pretty familiar with the software.

Any help on the matter would be greatly appreciated. My deadline is
coming up real soon so please email me with some advice ASAP! Thanks for
all your help in advance..

Email me ... aq004@torfree.net

PS: I know they teach this stuff in University.. I'm still a highschool
student =)

Hello, maybe this question is trivial, so please forgive me to ask it here:

Recently I found out that GEMDOS.MAlloc(-1) does not return the free amount
of memory but rather the largest free Block. Am I correct? And if so,
how can I find out the amount of free memory?

tanx Simi.

Don't know anything about the way spreadsheets work, but your problem
is easy to solve when you are going to use a recursive function.
Scan from left to right - as soon as an opening bracket pops up,
call your function recursively. I guess that is enough information
for you to solve this tiny little problem.
>

Hallo,
ich habe folgendes Programmierproblem:
Ich will vom DSP im Falcon eine FFT
durchfuehren lassen. Das ist eigentlich
ein Standardproblem, dafuer sollte es also
Loesungen geben, kann mir jemand sagen, wo
ich sowas herbekomme, hat da jemand Tips ?
Genial waere es, wenn da jemand schon eine
Loesung hat und sie mir zur Verfuegung
stellt, aber ein paar Tips sollten es
auch tun.

No. In a compiled language, any expressions such as that in your source code are read at compile time and converted into an assembly language program to evaluate the expression. There is no expression parser in the output of the compiler, so no simple way to pass a user entered expression to it. You'll have to do the parsing yourself.

What you need to do is to scan the line looking for terms to add up. Each term is then passed to a routine that scans through it looking for terms to multiply or divide, then each term of that is passed to a routine that scans through it looking for terms to raise to a power. Each of those terms is then either a number, or a function such as sin or cos, or an expression in brackets, in which case you pass the contents of the brackets to the first routine.

It sounds complicated, but it's fairly easy, particularly if you've got good string functions.

Well yes, spreadsheets also have to have an expression evaluator of course. But the difficult bits about writing a spreadsheet are storing the data in an efficient way and doing natural order evaluation, neither of which do you have to worry about.

Was *genau* hast Du da getestet? Wie *genau* hast Du die Zyklen gemessen?

Ich nehme an, dass Du den 68030 in einem Falcon getestet hast. Bedenke bitte,
dass im Falcon mehr Zyklen fuer Video abgehen als bei einem einfachen ST.

Generell hat der 68030 eine riesige Menge von Verbesserungen gegenueber einem
einfachen 68000:

- Beschleunigungen bei einigen Befehlen
- Neue Befehle
- eingebaute MMU (sehr wichtig!)
- eingebauter kleiner Cache
- kann hoeher getaktet werden
- ...

Hello,

Is there somebody on this news group that attempted to generate sounds with the DSP ?

As a basic program, I would like to implement a sine wave generator as described in Motorola's Application notes:

http://www2.motorola-dsp.com/dsp/engineering/tech_doc/app_note.html
(Acrobat Format).

And even easier if you use LEX and YACC (or better, the more modern FLEX and BISON) to do the lexical analysis and parsing. Setting up a simple expression interpreter using these tools is very easy. The YACC manual even used to come with a little example that did just that.

You could always write the function out to a text file, wrapped in a suitable function declaration like:

```
double userExpression()
{
     return <insert_user_function_here>;
}
```

Then all you have to do is run the compiler, dynamically link the object file your executable, and call the function. It might be tricky to get the variables passed in correctly, though. They may need to be globals.

;-)

Went through some old stuff and found 3 Atari computers. I din't know if they are really worth anything, but I hate to throw them away. If anyone is interested in these, I will be happy to send them for the cost of shipping..

Atari 130 XE
Atari 800 XL
and the good ole' Atari 400 ... my first personal computer. *sigh*

Let me know.

squonk@nb.net

Thanks!

Here's how I'd deal with the problem:
(rough solution!)

```
function EVAL_EXPR return FLOAT is
   RESULT: FLOAT;
   OPERATOR: CHARACTER;
begin
   RESULT := EVAL_TERM;
   while CURRENT_INPUT_CHAR='+' or CURRENT_INPUT_CHAR='-' loop
      OPERATOR := CURRENT_INPUT_CHAR;
      GET_NEXT_INPUT_CHAR;
```

```
      if OPERATOR='+' then
         RESULT := RESULT + EVAL_TERM;
      else -- OPERATOR='-'
         RESULT := RESULT - EVAL_TERM;
      end if;
   end loop;
   return RESULT;
end EVAL_EXPR;

function EVAL_TERM return FLOAT is
   RESULT: FLOAT;
   OPERATOR: CHARACTER;
begin
   RESULT := EVAL_FACTOR;
   while CURRENT_INPUT_CHAR='*' or CURRENT_INPUT_CHAR='/' loop
      OPERATOR := CURRENT_INPUT_CHAR;
      GET_NEXT_INPUT_CHAR;
      if OPERATOR='*' then
         RESULT := RESULT * EVAL_FACTOR;
      else -- OPERATOR='/'
         RESULT := RESULT / EVAL_FACTOR;
      end if;
   end loop;
   return RESULT;
end EVAL_TERM;

function EVAL_FACTOR return FLOAT is
begin
   case CURRENT_INPUT_CHAR is
      when 'A'..'Z' =>
         RESULT := VALUE_OF (CURRENT_INPUT_CHAR);
         -- adapt this one if variable names are more than 1 char long
         GET_NEXT_INPUT_CHAR;
         return RESULT;
      when '(' =>
         GET_NEXT_INPUT_CHAR;
         RESULT := EVAL_EXPR;
         if CURRENT_INPUT_CHAR /= ')' then
            raise SYNTAX_ERROR;
         else
            GET_NEXT_INPUT_CHAR;
            return RESULT;
         end if;
      when others =>
         raise SYNTAX_ERROR;
   end case;
end EVAL_FACTOR;

-- all the construction launched as above:

GET_NEXT_INPUT_CHAR; -- actually the 1st char of the expression
FINAL := EVAL_EXPR;
```

-- depending on how you get the input chars,
-- you'll see how to deal with the last expression char.

Good luck.

```

newsgroups: comp.sys.atari.programmer

After many hours of research, soldering, re-learning C and tapping in test code, then realising it was getting too damned close to my exams for me to finish this, my Enhanced Joystick Ports FAQ is now available from my web pages.

I would urge anyone who is programming for the Falcon/STe (especially, but not exclusively games programmers) to grab a copy of this. Just use the URL in my .sig and click on anything looking vaguely like an Atari link (HINT - It's got a Fuji logo, and the word ATARI on it).

It would probably also be of interest to owners of STes, Falcons and Jags (for the latter, it even icludes plans for a Tempest 2000 compatible rotary controller!). Please pass it on to other owners, too - there are some minor restrictions to this, but they are just to stop anyone making lots of money out of my research and not giving me any!

Cheers,

Xav

   Read a computer science book, but don't expect us to do your homework
for you. Find a good book on recursive parsing-- the source code for that
sort of thing is a page of code at most.

>dass im Falcon mehr Zyklen fuer Video abgehen als bei einem einfachen ST.

erstmal: richtig ich habe das auf einem falcon getestet.

weiterhin glaube ich, dass ich es ziemlich genau getestet habe.
ich hab einfach den zu testenden befehl 1000000 (!) mal ausfuehren lassen und hab das
ganze dann 10 mal geloopt. die zeit habe ich gestoppt und dann auf eine einmalige ausfuehrung des befehls zurueckgerechnet.
noch dazu habe ich das ganze bei 640*200 *2 farben gemacht wodurch der videospeicher
kleiner ist als auf dem st !

>Generell hat der 68030 eine riesige Menge von Verbesserungen gegenueber einem

welche befehle sind denn beschleunigt, wie schnell sind die ?
welche neuen befehle gibt es denn ???

That's an interesting idea.. but a bit clumsy to start the compiler just =

for that. Or else you could write it as a scriptfile(batchfile) like =

this:
eval <userinputstring>
then you could simply execute this file, and then use the returned value =

as the aswer. Note that <eval> is the Amiga command for this kind of =

operation, replace this with whatever appropriate for your system. Could =

be a problem with a Mac though.. it must be possible in some way.

  eglis@ubaclu.unibas.ch (Simon Egli) said:-

>Hello, maybe this question is trivial, so please forgive me to ask it
>here:

The question may be, the answer is definately not trivial!

>Recently I found out that GEMDOS.MAlloc(-1) does not return the free
>amount of memory but rather the largest free Block. Am I correct?

You are.

>And if so, how can I find out the amount of free memory?

It depends on what you mean? I'll assume you want to add up all the free blocks - but remember they are separate. There is no way *your* program can (reasonably) join them together to make a larger block.

The most portable way to do this is to use only the tools you are guaranteed to be provided with - Malloc() and Free(). Something along the lines of ...

```
/*
 blkptr     = some array of longs
 blkheadsiz = size used by header
*/

n = 0
total = 0
blksize = Malloc(-1L)
WHILE (blksize NOT ZERO)
     blkptr[n] = Malloc(blksize - blkheadsiz)
     n = n + 1
     total = total + blksize
     blksize = Malloc(-1L)
ENDWHILE

WHILE (n NOT ZERO)
     SUBTRACT 1 FROM n GIVING n  /* aggh cobol! (n = n - 1) */
     Mfree(blkptr[n])
ENDWHILE

PRINT total
```

This solution begs the question of how big the blkptr[] array should be and how to obtain the value of blkheadsiz. For a generic solution blkptr[] must be obtained dynamically which complicates things. For portability across operating systems, you can make no assumptions about the size of blkheadsiz so this must be calculated also.

Under a multitasking operating system the above code would have to be run in supervisor mode to block task switching ...

```
ENTER SUPERVISOR MODE
total = TOTAL_MEMORY()  /* ie the something like the above code */
LEAVE SUPERVISOR MODE
```

The OS can now task switch again. It leaves our process (A) and hands control over to process B. Process B then Malloc()'s (or Mfree()'s) some memory. Another task switch back to A ...

All we've achieved is to find how much free memory there was at the time we checked - pretty useless except to provide a real time display of memory. There is *no* other purpose for doing it.

If we can guarantee the code will run on known systems then it would be a trivial matter to follow the OS free memory chain adding up the sizes of the blocks.

The only way to obtain extra space whilst a program is running is to try and Malloc() it and provide code to recover if the allocation fails but note the following pitfall when attempting to allocate the largest block ...

```
char*
biggest_block()
{long    n    =Malloc(-1L);
 char    *p   =Malloc(n);

 return p;
}

/*
 * WRONG
 * possible task switch between Malloc(-1L) and Malloc(n) above
*/

main()
{char    *p   =biggest_block();
}

/*
 * CORRECT
 * task switcher blocked.
*/

main()
{char    *p   =Supexec(biggest_block);
}
```

Hi !

I'm programming, as a hobby, game engine which is Captive/DM type, 3D perspective rpg (NOT DOOM like). I'm programming it with GFA Basic 3.5E and Falcon. I might change to HBASIC if I start using non ST screen modes or If I want to compile it, because I have not get my GFA-compiler(3.5) work correctly in my Falcon.

My mouse routine works now as it should, with pageflipping too. Also I have done routine to check all visible 3d parts of screen to be seen (and drawn too).

My problem is memory taken by pictures.
I have drawn picture for each possible walls/floors/roofs in 3d vision. There is only 2 type of texturetypes to these but they allready take 3 NEO screens.

Is it better to draw only one wallpicture (ex. 160X100) for each types and calculate all others from that ?

Is it better to use packed pictureformats (which)?

I've thinked about changing resolution to 640X400 16C/256C RGB or 640X480 16C/256C VGA, because it looks much better that way. So I have to change the format of pictures too. Maybe its GIF type if I can get some info of that format and learn how to act with it.

Any comments are welcome !

Miquel

There is a shareware program called 'jprommer' for DOS which is available
from some Mausnet BBS and which is said to support megabit EPROMs, too. I
have not tested this, myself - I prefer Pinatubo :-)

Just to let everyone know node 90:90/0 is now back up and operational.

The downtime yesterday was indeed due to the power supply (a capacitor
in fact) dying and so no power was getting through to the Mega ST4.

The Mega ST4 is now piggy backed on top of an old DEC Alpha (with no
top on) which is supplying the power to the system.

It looks a lot like a derelict spacecraft, but at least we're up and
running for mail once more.

Out of the ether, the following was mentioned by
david.white@rd.eng.bbc.co.uk...:

```
 d> parsing procedure. The parsing procedure could then run through your
 d> configuration
 d> file and assign the values. Thinking about it, the easiest method
 d> would be to
 d> malloc an array and set the last structure in the array to have a
 d> string of "",
 d> indicating the end of the array.
```

Hmmm, this is similar to what I envisioned apart from my routine parses the
file a line at the time without reading it into memory first. It may be a
little slower but disk caching seems to offset that.

```
 d> typedef struct _config
 d> {
 d> char *setting_name;   /*pointer to "setting=" string */
 d> char *setting_value;  /*pointer to result, assigned by parsing
```

 d> procedure*/
 d> }config_struct;
I must admit I hadn't thought of using a struct to store the settings.

 d> setting_value string's memory and then frees the config_struct array
 d> after you have finished
 d> with it.
Yep.

 d> I'm sure this idea could be improved upon, but is it any help?
Most certainly especially the idea of using a struct to store the settings, I
hadn't considered that angle.

Spencer

   spencer@mettav.demon.co.uk

interface it.

Here are the files I have tried.

I know, the code is lame, but you've got to start somewhere ...

"k_falcon.h" is the gcc Falcon binding by Howard Chu,
just tidied up a bit, with the Lattice bindings stripped out.

Thanks for any help in advance,

Karl.

Hi.

Here's another attempt I've made, but I get the following warning.

```
******
trial1.c: In function `tc_pixel':
trial1.c:56: invalid `asm': operand number out of range
trial1.c: In function `main':
trial1.c:87: warning: value computed is not used
******
```

This is on the line that reads

```
******
              movew         %3,0(a0,a0.l*2)"
******
```

obviously this is a problem with the way the instruction is structured,
but it's beyond me to make it simpler or acceptable to gcc-as...

Any tips/ideas/hints/code?

Many Thanks,

Karl.

9227466@bud.cc.swin.edu.au

Quite complex, but nevertheless interesting.

I'll definately look into using such structures for my config file processing
as it could make life far easier in the long run which is part of the reason
for going for a generic approach.

If you want to mix MOT and MIT syntax, you'll need to update
gas, else you'll have to use pure MIT syntax.

(I assume the second a0 should read d0)

Hello,

Let me introduce you MIDPRDXL.PRG, a strange little program for MIDI synthesizers:
It allows you to play melodies with paradoxical scales on MIDI synthesizers.
You just need an ordinary polyphonic synthesizer (such as a D-5 Rolandus
simplex vulgaris) and an Atari to discover this stunning kind of musical
scale.

What is a paradoxical scale ?

The principle of paradoxical sounds was invented in the early 70s by
Risset and Shepard.

If you play the melody CDEFGABC on a normal synthesizer, the frequency
of the last C will be twice the first C frequency. On a paradoxical
synthesizer, the last C will be the same as the first one !
A paradoxical scale is circular. So, this kind of scale allows you to
play infinitely ascending or descending melodies.

So, when running correctly MIDPRDXL, the lowest C and the highest C of
the keyboard will play the same note, but you will be able to play melodies
"as usual".
Strange, isn't it ?
Here are some explanations...

You will find those explanations on my Web page at:
http://www.ief.u-psud.fr/~thierry

Paradoxically yours,

Thierry Rochebois

Subject: STik and CAB problem
Date: 1996/04/04
Message-ID: <4k023i$28k@lithos.kapatel.gr>#1/1
X-Deja-AN: 145835330
organization: Kapa-Tel -- D. & G. Kalofolias S.A.
newsgroups: comp.sys.atari.programmer

I tried to use STik and CAB yesterday. STik dials the number and it says "dial succeed" in the status line and "carrier detected" in the string line. Then it says "find string" in the status line and shows the first string i told it to find in the dial.scr file. These are shown for 40 seconds, then it says "timeout finding" for 4 seconds and the STik window closes. I think it should show the string it tries to find each time and not only the first one for 40 seconds! Is this right?

Anyway, after that, i load CAB and try to open a URL. It says "resolving host", the RD and SD leds of the modem are on and off for a minute or two and then they stop lighting and the "resolving host" message continues to appear even if i wait for hours! Nothing else happens!

My provider offers (C)SLIP and i thought this is the reason i cannot see any web pages on my ST, but the sysop told me that there is an auto detection for (C)SLIP or SLIP demand and there should be no problem. Does this auto detection works only with TCP/IP stacks on
PCs?

Yes, it isn't getting the first line so it's not getting past the
first FIND. What is the *exact* logon sequence required by your
provider? If you don't know, use a standard comms package to find out
what the provider's end wants.

> Anyway, after that, i load CAB and try to open a URL. It says

This will go away when you fix the above.

I can't be certain but I would be *very* surprised if this is the
case. TCP is TCP, fortunately even Microsoft can't impose its ever
changing standards on it yet!

Thanks for all the private email, solving my problem with
evnt_multi()! It really WAS a pointer problem, caused by
my efforts to use the Mark Williams method in Lattice C.

<sigh>

The problem was:

```
#define UNUSED 0

 short *keyin = UNUSED ;
```

The solution was:

```
#define UNUSED 0

 short placeholder = UNUSED ;
 short *keyin = &placeholder ;
```

Thanks, Jim, Mario, and ... (oh-oh! this isn't intentional!),
for all the help and advice!

Well, I can't imagine you haven't heard from GNU c/c++ yet, but
I'll mention it anyway. There are two other compilers, that I'm
not too familiar with: Sozobon and c68.

You can get the GNU compiler from almost any ftp site.

There is a 1.40 version with moderate memory requirements,
a 2.3.3 version with bugs fixed/features enabled (baserel) that
requires 2MB or more (I have plenty of it) and
2.5.8 and 2.6.3 (has anybody seen 2.7.2 ?) but these seem to be
not as stable as 2.3.3 for me.

Hi there,

I am planning to write my owm midi-program on an Atari ST, since Cubase is
too expensive and Happy Music is too constrained.
All the efforts I made were too slow, so I now want to use MROS, the
operating system made by Steinberg. I have a few questions:

1. How do I install MROS? (I already have a version of it)
2. How do I use MROS to play MIDI-notes?

The first question is not that needed, because I can use Happy Music to
install MROS. Can anybody answer these questions, or give me any pointers
to where I can find the answers?

The program I am planning to make becomes public domain, so anyone can
get a copy.

Please if you reply, also send me email.

Regards,
Koen.

PS. Does anybody know of any public-domain good midi-program for the Atari?

I've been converting a very old ST Basic bridge game to Hisoft Basic, and I finally got it finished. But...I've got a weird problem. Now whenever I run the compiled program I get the same cards. i.e. The random number generator hasn't been seeded properly. This old program uses the RND function, probably a bad command compared to whats available in Hisoft Basic.

Is there any way to get a random seed from the system clock, and should I be using a better command than the RND one that the original ST Basic program used?

Thanks for any help.

John

The example in the MWC Manual on page 326-327 specifically sets the
pointers passed to event_multi() to the existing legal address of a dummy
variable array called 'nowhere[]'.

Sorry to be picky about this.

I've read somewhere that the ST sound chip actually has 4 channels and only 3 are useable for decent sound. The fourth is used for "white noise" but it may be adjustable. Is this true? And if so, how may I be able to use this white noise? It's for a game I'm writting that will use samples(which the 3 channels are tied up for) and I want something like fly buzz on the 'fourth' channel. I program in both STOS and 68K assembly right now. Could someone help? Thanx :)

PS: If I can't do this then how may I use the three sound channels
in STOS?

This is usual for debugging purposes.

>ST Basic program used?

Dunno about Hisoft Basic but you can get a random number from the
system Random() function (xbios 17) which returns a 24 bit pseudo
random number. The initial seed is taken from the vertical blanking
frame counter so should be different each time the machine is turned
on. iirc the distribution of bit 0 is poor so you should always
discard it (shift it right one place).

Yes, there is an internet project called BAD MOOD that's making it happen.

The Falcon030 is the target machine since its DSP chip and 16 bit graphics mode are needed to get reasonable speed.
If a lot of DSP code was converted into 68k assembly, something usable could probably be written for other fast Atari machines as well, though.

The latest version (2.06) can use any DOOM, DOOM II or Heretic WAD with textures (those are usually several megabytes). Apart from the sky everything is texture mapped as it should be (including transparent textures) with light effects. There are no sprites of any kind yet, though.

(Older versions (1.8 or 1.9 IIRC) uses two internal textures and can therefore be used with any WAD, even those without textures.)

The frame rate on a normal Falcon with VGA monitor in 320x200, with full texture mapping, is usually around 3-5 fps. The resolution can be changed on the fly and at 160x100 you could well get 15 fps.
The 16 bit graphics mode makes DOOM/Heretic look quite a bit better than they do on the PC. :-)

Take a look at my WWW/ftp site (see .sig) for more information and the program archives.

There is a mailing list you can join if you want to keep up to date.

newsgroups: comp.sys.atari.st,comp.sys.atari.programmer

Can someone give me an explaination of the graphics (not text) modes available on the Atari ST? I'm reading through some file format specs for the Atari ST (NEO, PI, PC, TNY, etc.) and I see mention of low, medium, and high resolutions, but nothing on the size and pixel depth of these resolutions. The standard screenshot size seems to be 320x200, but the Atari FAQ lists 320x192 as a

standard graphics resolution. The FAQ also does not explain "overscanned" and "underscanned" modes. I assume this is how Atari achieves 640x200x4 resolution?

Somebody care to enlighten me? Thanks much.

>Somebody care to enlighten me? Thanks much.

The ST has 3 "normal" modes :

- 320*200*16 colors (ST Low)
- 640*200*4 colors (ST Med)
- 640*400*2 colors (monochrome) (ST High)

The Overscan Modes use special techniques to increase the resolution
available. The problem is that there is several different technics
which do that but they are not (all) working on every STs.
In fact there is not a lot of graphics format which use such technics.
There is the .KID format which use overscanned mode in ST Low (I don't
remember the name of the program which manage this kind of file).

Most of the painting program on ST use exclusively the three modes
(like DEGAS ELITE PI1/PC1, PI2/PC2, PI3/PC3)
or only one of them (NEOCHROME .NEO)

Some use special format like SPECTRUM 512 (.SPU, .SPC)
which work in ST-LOW using only 199 lines but 512 Colors in the same
time (using a special technic consisting on changing 3 times the color
palette per line)

I hope I answered your need.

ST-Low: 320x200x16
ST-Med: 640x200x4
ST-Hi : 640x400x2 (Monochrome)

Overscanning is achieved in one of two ways. One is a hardware hack which removes the borders. The other is through software, which removes the top, bottom and/or side borders. Removing all four borders is processor intensive, however, so there aren't many CPU cycles left over for other things. Overscanning achieves somewhere in the neighbourhood or 360x240 or so, with all four borders removed. It's usually necessary to scrunch the monitor's horizontal screen size to see a fully overscanned screen.

Hi everybody!

I definitely NEED a tiny program which would, used as an accessory, force the Atari ST to change the STEP RATE FOR THE FLOPPY DISK b: from 3 ms (default) to 6 ms.

I builded an interface to connect a HD floppy to an ordinary ST with TOS 1.02 and it works fine, but I have to do this re-setting every time when I need to work. I do it with FastCopy. But many programs, when started (e.g Cubase) seem to re-set the whole machine, thus disabling my little tricks. So it definitely should be an accessory.

Please, help. I believe there's an easy way using Xbios function(s) from GFA, but I don't have any time to study this better.

This program would, along with the description of this interface, probably be posted to all newsgroups interested (if any).

Here's some info on Atari ST Graphics Modes

	X	Y	Colors	Bit-planes	
ST Low	320	200	16	4	32,000 bytes
ST Med	640	200	4	2	32,000 bytes
ST High	640	400	2	1	32,000 bytes
TT Low	320	200	256	8	153,600 bytes
TT Med	640	480	16	4	153,600 bytes
TT High	1280	960	2	1	153,600 bytes

I don't think The ST or the TT use any king of overscan, but I'm not sure.

I have a text file that lists all the known Atari Graphics file formats.

Hope this helps,

Jim Fouch

How much overhead is just removing the top and bottom boarders?

I have a source code for this demo that can do this in 50Hz mode and
I want to put this in a game I'm writting so it'll automatically do
overscan on European machines. I appears that I have to keep
accessing the routine with each vbl. The game is in STOS, but I can
use assembly rountines with no problem. Is there anyone who can tell
me more about it? Thanx

Just in case it wasn't fully clear from the other replies... the Atari ST
has only *3* graphics modes:Low, Medium and High, with the pixel resolutions
given in the other replies.

The other "modes" are hardware or software hacks to achieve non-standard
pseudo-resolutions.

As was mentioned, not all STs can use all of the non-standard resolutions.

For complete compatibility, you have to stick with the standard three.

BobR

The standard ST and STE modes are 320x200 4 planes, 640x200 2 planes, and 640x400 1 plane. The ST has a 512 colour palette, the STE 4096.

If it's just the hardware modes you are after then that's it, but if you want to know what resolutions the machine can do then the answer is any because the OS is resolution independant. Software solutions either slow the machine down or require you to scroll round a larger virtual screen. Hardware solutions are obviously the best and depend on the spec of the card - which are damned expensive because they are hard to fit - shame really. As you have probably guessed by now, overscan can be done by software or hardware, or both.

Gem is resolution independant so I assume you mean the software has to
be also be capable of running in one of the three standard modes?
(sorry to be pedantic but I missed the original question). :-)

No I didn't, I've found it (after the replies *again*) ...

He asked about graphics modes in general, not hardware modes, so it
seems best to let him choose if he wants to be bothered with the
information?

The top and bottom borders don't take much time. It's the side borders
that really eat processor time because they use the HBL, not the VBL; the
HBL is a 200Hz interrupt.

You could modify the overscan routine to run itself, rather than run every
time it's accessed. That would produce more stable results, and would
also be easier to use from within STOS. I don't program in STOS so I
don't know what's involved in accessing assembler routines from STOS
programs, but if it's anything like GFA then it should be a doodle.

In the XBIOS function I think, you can not only read the resolution mode number but actually can change it. On the ST, it's 0 for low, 1 for medium, and 2 for high. And I can switch between low and medium resolution for TOS programs, it messes up the GEM display which thinks it's on the old resolution but use a VT52 clear command and it works. This is what I'm going to do with the text file reader I'm written(after my game's done) and what Darek did with QuickView.

But there are the "extra" modes for higher machines like TT, Falcon, and even for Gemulator. If anyone can give me a good idea what these numbers are, that will be helpful. However, the program will switch to either ST Low or ST Med except when it's on those 'true' modes, not the extra ones on the Falcon. And yes, it won't do switching on a high rez monitor.

Utter bullshit. All GEM programs are resolution independent.

Hello, world!

I'm currently writing a command shell, and got a few questions.

First: How does Pexec work? In my header file (I use Alcyon C, OSBIND.H) says it is Pexec(mode, prog, tail, env), using Gemdos(trap 1) function 0x4B.

Second: How do I surpress CTRL-C? I don't want my program to stop after pressed CTRL-C, but do other things.

Thanks!

With kind regards,
Bert Greevenbosch.

If you program in STOS BASIC you may like to obtain the latest version
of the EXTRA extension.

I suggest you dive into the WWW page
http://www.airtime/co/uk/users/sinbad/download.htm
and get yourself the latest version of this shareware title.

Currently at version 3.26

Maybe he was thinking of the v_enter_cur() and v_exit_cur() VDI calls,
which *would* cause one to enter text mode on other (non-TOS) machines.

I tried this URL and could *not* get a connection. The server could find
no DNS entry for www.airtime. Could this be an incorrect URL? Please
post or email me with the correct URL. The original STOS BASIC I have is
very buggy. I am very interested in getting the latest on STOS BASIC.

Perhaps you should have mentioned that over- and underscanning
can be acieved through hardware on the Falcon. And that is propably
what was discussed in the FAQ?

Yep, Getrez(). It has an inherent problem - it doesn't know about
generic resolutions, like graphics cards or ones you make up yourself.
The VDI will know. You can ask it the width, height and number of
planes etc.

>And I can switch between low and medium
>resolution for TOS programs, it messes up the GEM display which

This is fine as long as you do not want to use Gem whilst not in the
"old mode". TOS knows about resolution changes 'cos it's fairly simple
to make the machine do. Gem isn't told because it's too difficult to
expect it and programs running to adapt on the fly. Even multitos
requires applications to terminate I'm told.

>But there are the "extra" modes for higher machines like TT, Falcon,

>a high rez monitor.

I'm afraid I don't know the non ST ones but you are right in the
assumption that Getrez() values will change when the resolution does
unlike the VDI.

>1) function 0x4B.

There's a Pexec() cookbook doc out there somewhere. If you track it down can you let me have a copy. In the meantime here's what I know about it ...

mode
---

0 Load and go.
3 Just Load.
4 Just Execute.
5 Create Basepage.

0,3 take the same args ...

prog=executable file.

tail=PC type command tail or NULL.

env=environment string or NULL to inherit current environment.

prog should ideally be fully specified.

tail[0] is the length of the command tail. tail[1 ..] is the actual command tail. iirc, the ARGV extended argument format originally introduced by MWC exists if tail[0]=127.

Mode 0 returns a gemdos error code, mode 3 returns a basepage pointer and all details appear to be filled in correctly as per mode 0 except p_hitpa points to the top of ram and p_parent is NULL.

Mode 4 just takes the basepage pointer returned from Mode 3 and executes - thus Mode 0 is Pexec(3),Pexec(4);

Note that under MagiC you need to use shel_write() in most cases. The only need for Pexec() I have found is for TSR's and for overlays.

>Second: How do I surpress CTRL-C? I don't want my program to stop
>after pressed CTRL-C, but do other things.

etv_term (longword at system memory address 0x408) is the process
terminate handler. Default points to an RTS instruction. If you want
to regain control install relevent code here.

iirc, MagiC maintains a copy of this for each running process which is
dead handy if you plan to hook into the system. So if the user kills
the process off then the code here can unhook itself to prevent a
system crash.

Mode is most commonly 0, prog is the pathname of the program, tail is
the command line to pass, and env is any environment you want to pass
(generally, an empty string).

>Second: How do I surpress CTRL-C? I don't want my program to stop
>after pressed CTRL-C, but do other things.

Good question. I'd like to know the same thing--especially with
regard to Gemdos trap 9 (text to screen).

Hello:

I am interested in getting a hold of any reference material for
programming with STiK. The two programs I wish to develop will be
used by my BBS software and therefore would be designed to be run

unattended. As such, they need to be able to invoke STiK without user interaction -and- close STiK afterward in order to restore normal modem access. So far as I have seen (I do not yet use STiK since I have a PC at school--I will use STiK during the summer), STiK is an accessory so invoking it unattended -may- require changes in STiK itself.

The two unattended-mode tasks I want to look into are ftp and NNTP clients. I have read the RFCs for these and really just need to know how to open a connection/port, send/receive data through that port, and close the connection via STiK. Just tell me where to dump the bytes and what "exception to throw" and I'll be happy. Of course if there are already available detailed STiK reference docs, that would be nice, too.

Were you refering to XBIOS calls where you read and set the
resolution modes for mainly TOS programs? I only know 0 to 2. The
ST can switch them and use them for the VT52. GEM itself doesn't
even know about the toggle.

My concern is with does the Falcon, TT, or Gemulator have any extra
XBIOS modes other than the three for the ST?

Hi.

I made this posting a while ago, but received 0 replies. So I'm
trying again, hoping that someone will listen this time.

I'm trying to write a function to plot a pixel in 320x200 TC mode.
Got the code, but one instruction the GCC compiler doesn't like.

Can you lot help me fix it!?

Many Thanks, Karl.

Here's another attempt I've made, but I get the following warning.

```
******
trial1.c: In function `tc_pixel':
trial1.c:56: invalid `asm': operand number out of range
trial1.c: In function `main':
trial1.c:87: warning: value computed is not used
******
```

This is on the line that reads

```
******
              movew         %3,0(a0,a0.l*2)"
******
```

obviously this is a problem with the way the instruction is structured,
but it's beyond me to make it simpler or acceptable to gcc-as...

Any tips/ideas/hints/code?

My code follows.

Many Thanks,

Karl.

9227466@bud.cc.swin.edu.au

Hmm ... I'll just pass on this reflection and let others verify it's
sanity ;-)

In C, Ctrl-C won't happen unless you call the OS in some way (printf,
gets etc). A possible solution could be to peek into the stdin buffer
before doing any OS calls (and then discard the Ctrl-C char if any)

Hmm, after leaving my disk on top of my TV for the past few weeks, I come to do some coding and find everything's gone all funny. My files are not what they once were. My 3d routs have been trashed along with some mfp code, and a load of crap gfx I did. Sorta reminds me of the need to keep a backup from now on... Fortunately, my line-drawing routine is still around. I'd printed it out to have a look at to see if I could see any ways of speeding it up. I finally figured a way out and went to code it and well, lots of rubbish filled my editing window. I'm almost finished re-typing that lot and will post that tomorrow. Currently it's about as fast as I can think of making it - though any help would be appreciated on it. If the rout was just run over and over again without any time left to call it, set up regs, etc. you could draw approx 122 full scanlines per vbl. I figure even with calling code and setting regs up and other rubbish you could still get away with 100 scanlines per vbl. Pretty fast eh?

Anyway, that erasure of my source gives me the opportunity to re-code my full polygon routine. About time too really as well I think. I'm still not sure about the best way of drawing a polygon. I've seen the edge-list fill algorithm and must reject it on the grounds that it'll be far too slow:

non-integer numbers required, lots of divisions, etc. seem to make it unsuitable for high-speed, but I'll have another look at it and see about changing it a bit for speed. I should be able to get rid of non-integers by left-shifting everything and then adding/subbing as normal then right-shifting the result back, but I'm still not sure about the rest of the rout - looks slow to me.

The only other way I know of is to calculate the outline, storing the x-coords in a table. ie, a table of 200 long-words, each long representing the start and end co-ord of that scanline. However, this forces me to use convex polygons. For speed though I think convex has to be the way to go.

Anyone got any other suggestions for drawing a polygon (filled)? The table method means that it's easy to clip the polygon, and with some juggling it may be possible to remove the clip routine entirely anyway and bung it in with the polygon drawing rout. I've had some thoughts on this line and like the way things look. But then I thought some more and found that this might not be too good. Anyway, I'll get a simple polygon filler working and worry about clipping the damn thing later. For simple demos where you know the polygon won't be larger than the screen everything's cool.

I don't know the GCC assembler syntax, but I think what you're trying to do is an acceptable 68030 instruction, but (for sure) isn't valid 68000 code. Perhaps you need to tell GCC it's for a 68030.

Roger

```

I haven't a clue about GCC or its assembler so please bear with me but
how does a0 get initialized? and what is the relevence of manipulating
d0 and d1 if they are not used?

Also, my assembler would not accept a0.l*2 - it would have to be
something like this ...

```
move.l   a0,dn
lsl.l    $1,dn
move.w   %3,0(a0,dn.l)
```

I've made a texture mapped polygon routine on my Falcon. It draws
approx. 1.3 million pixels/sec (a cube). That is, one 030 instruction
per pixel and 6 DSP instructions. I'm storing the x-outline in a
table and no divisions are required since I'm using a table
with inversed numbers.

Noring

Hi there...

Gary Ingram (Gary@gingram.demon.co.uk) wrote:
: Last time I had access to this newgroup, (long time ago) there was a never
: ending thread running regarding the possibility of a Doom alike on an Atari
: machine.
:
: Anything ever come of this?

Yup!. There are several projects around to port Doom (1 or 2) to the
Falcon or maybe even STe. The best known of these is called Bad Mood. Bad
Mood runs only on the Falcon and the latest version (v2.06?) uses the
original IWAD files that come with Doom 1/2 and Heretic. Currently it is
just a viewer ie..you just run around the 3d world looking at things.
There aren't opening doors but you can walk through the walls, and there
are no enemies or weapons etc...yet!! The graphics look very good, with
Falcon 16-bit colour mode being used to enhance depth shading and so on.
The graphics are in fact far better looking than the original on the PC!!
Soon (we hope) some things like solid walls, opening doors, and life
(other than you) will be used in the coming versions...

Hope this helps...

Chris W.

I did some overscan on my STE five or six years ago, and it was actually very easy to remove the lower border.

The way I did it was to install a HBL-routine that just incremented a counter, it counted scanlines. And when the counter reached 199 (The second last scanline), I changed the HBL-vector to point to a new routine that did the actual overscanning.

It just waited a specific number of NOPs (9?), changed from low to high resolution, then waited 4 or 5 more NOPs before it changed back to low. That was enough to confuse the shifter, and it ignored the DE-signal.

I can't remember how I removed the upper border, but it was a bit more difficult. It also used more CPU-time.

This is called "index scaling", not supported by the 68000 and
68010. The scale factor (0..3) is the number of bits to shift
the index register.

In MOT syntax this is written as "reg[.size][*scale]". If
omitted, scale defaults to 1 (scale factor 0, aka unscaled).

Regards,
Waldi

I could whip up a ten line program in a couple of minutes which is "GEM compliant", but is most definitely resolution dependent.

And I bet 90% of the people reading this comp.sys.atari.programmer could do likewise.

Hello, world.

I need to turn on and off the mouse cursor. I guess I should use the initmous(type, param, vptr) (XBIOS, trap 14, function 0) function. Does anybody know how to use this function?

Also, does anybody know where to get reference about GEM, BIOS and XBIOS functions on the net?

Thanks!

With kind regards,
Bert Greevenbosch.

What is the fastest way of getting the size of a file
under MiNT? Please note that Fsfirst can't be used
because it doesn't work with long filenames.
So I need to know how to get the filesize using MiNT
functions.
And no MiNTlib functions please, as I don't use MiNTlibs.

Thank you,
Arto Jalkanen

Does anyone know the value of the WM_ICONIFY variable given in the Magic 4 hyper text documents.

I understand how to add the Icon gadget to the window title/move bar, the GEM event message that signifies this item being selected and the GEM event message recieved when a window is returned to full size. All I need to know is HOW to iconify the window!

Rarther helpfully the docs gives the following example:-

wind_set(wind_handle, WM_ICONIFY, -1, -1, -1, -1)

I believe this call both shrinks and expands the window, but what is the value of WM_ICONIFY!!!!

Thanks in advance for any help.

What sort of program are you writing because this is a very low level
call. If it were any lower you would be dealing with the hardware
itself!

Gem programs use either the AES or VDI, both have functions to deal
with the mouse such as graf_mouse() and various VDI functions. Use
either AES functions or VDI. Mixing them can confuse the system unless
you are very careful.

Tos programs do not have any mouse functions as such. However, the
LineA interface can be used to control it quite effectively.

>Also, does anybody know where to get reference about GEM, BIOS and

There are docs around but offhand, I can't think of anywhere. :-(

Hypertext? I haven't seen those, only the flat-text docs. Are the HT
versions in English? Where can I get them?

>   I believe this call both shrinks and expands the window, but what is
>the value of WM_ICONIFY!!!!

(I think that should be WF_... etc. in the wind_set call, not WM_...)

Nope, it just shrinks the window. You use WF_UNICONIFY to bring it back
again.

Anyway, from the MAGX.H header file that comes with the programming docs:

```
#define WM_ICONIFY          34
#define WM_UNICONIFY        35
#define WM_ALLICONIFY       36
```

These are sent to you by the window manager (i.e. through evnt_multi()).
You then respond with wind_set() using the values:

```
#define WF_ICONIFY          26
#define WF_UNICONIFY        27
```

I believe I obtained the (German) programming documents from
ftp.uni-paderborn.de - look for mgx4doc.lzh

Well, wind_set() does both expand/shrink the window, but you also need
WM_UNICONIFY and WM_ALLICONIFY [not sure about the lasts name].

I believe that WM_ICONIFY=25, WM_UNICONIFY=26 and WM_ALLICONIFY=27. I could
very well be wrong, so I'm sure someone will correct me. (Try checking the
GCC include files - I expect that these constants are defined there...)

The above info is for AES 4.1, but I believe that Magic handles it in the
same way...

Anthony

Scanline drawing routine documentation

By G. Jones (email: gjones@cs.man.ac.uk)
22nd April 1996

By the time you read this, you'll probably have already had a peek through the code, so you'll have a better idea of what I'm talking about. You might want to print out the source so you can look at it whilst reading this. (Or the reverse if you're like that). This was meant to be used in a polygon filling routine, but after leaving my disk on top of the tv it got pretty garbaged. Fortunately, I'd got a printout of the scanline routine (I'd been using it to see where I could make any improvements) and so here it is. This is a very fast scanline filling routine, hope you like it.

The routine is designed for ST low-res (320x200) and can draw in any of the sixteen colours. The routine takes in the start and end co-ordinates of a line and fills it in at the scanline chosen. Thus, by having a table of the start and end x co-ordinates for every scanline, a polygon can be drawn. This is the heart of any polygon rendering system. Note that the routine does not cater for lines with holes in them - for speed purposes it was necessary to impose this restriction.

For those who want true speed, sixteen separate routines should be developed, which draw a scanline in one colour only, thus the low-res 16-colour palette is catered for at the best speed possible. A simple left-shift of the colour value will produce the offset for the routine to be used (providing of course that each routine is put on the correct boundary). Though this would result in a better speed, it would result in an excessively long post. Besides, I wanted a working line routine first, before attempting pure speed, so I leave that up to you.

To understand this routine, a knowledge of the ST's low-res screen format is needed. For those who do not have this, here's a quick guide:

The screen is made up in an interleaved format. This will become clearer in a moment. Since we can only use 16 colours, we need 4 bits to store this information, eg 15 is 1111, 0 is 0000, etc. Note that although the palette has 512 colours we can only use 16 of these at once. So, how is each pixel stored? Well, the natural way would be 1 byte = 2 pixels, but that's not what Atari did. The first word (2 bytes) contains the first bit of the first sixteen pixels. The second word contains the second bit of the first sixteen pixels. The third contains the third bit of the first sixteen pixels. And the fourth word contains the fourth bit of the first sixteen pixels. Sounds complicated at first, but you'll get the idea in a minute:

```
0......70......70......70......70......70......70......70......7
\--------------/\--------------/\--------------/\--------------/
    1st word        2nd word        3rd word        4th word
    plane 1         plane 2         plane 3         plane 4
```

So, if we wanted to make the first pixel colour 16 (%1111 in binary), we'd set bit 0 of plane 1, bit 0 of plane 2, bit 0 of plane 3 and bit 0 of plane 4. Now get the idea?

Ok, that's it for the screen. Understand that and everything's cool.

Right, onto the routine itself.

The idea is simple - to fill part of a scanline in one colour we should realise the following:

That since the line can start from any pixel, most likely it won't be the start of a word, ie the first word we have to do will not be a full word.

Most of the line will be whole words.

The end of the line might not be a whole word too.

Thus, our routine simply draws the first word, fills the bulk of the line, then draws the final word. The trick lies in getting the most speed out of drawing the bulk of the line.

And that's it, but, time to go through the source in detail now that you understand the principle.

First off, into supervisor, save the stack, screen address, put in a new stack, and set up a screen for us to use. Into low-res and display the screen. Now make some tables for the routine to use.

First thing to do is make a lookup table of the addresses of each scanline for our screen. This saves working it out later. Of course, for more speed when drawing a polygon, going from the top of the polygon to the bottom, it would be better to setup the starting scanline address and simply increment that by 160 each time you've called the routine. This'd save a movea.l d(an, ix) each time you call do_line. The table would then only be used at the start of drawing the polygon.

Ok, next we make a mask table. This is for when we draw part of a word. We need to be able to cope with all permutations - ie, from bit 0 to bit 15 to bit 3 to bit 7 all the way to bit 15 to bit 15. This is done by each entry being 32 bytes
long. (An easy multiply factor as well). Thus entry 0 does bit 0 to bit 0, bit 0 to bit 1....bit 0 to bit 15. Which is 2 bytes * 16 = 32 bytes. This is done for each entry. As with almost all assembler programmes, the use of tables helps speed, so long as you've got the memory.

Next, we make a simple table to hold the start and end co-ords of each scanline that makes up a simple polygon - in this case a diamond. This is just one way of storing the information, and a simple one. There are others.

The main loop then sets up the registers, then draws the polygon, and loops until space is pressed, when it restore the screen, user mode and quits.

Now, the line routine itself.

There's lots of comments in the routine so that should help a lot, but I'll include any extras I think appropriate here.

To start with, we get the scanline address from the table, and then must find at which word the line starts from. This is done by anding $fff0 with the start x co-ord. The result then gives the nearest 16-pixel boundary. Of course, for the screen this is divided by 2 since 1 byte=2 pixels.
Then we see whether the line fits in 1 word, if so we can just get the mask, draw it and exit. Otherwise, we draw the first word then draw the rest of the line.

As with other parts of the routine the next bit (do_line_1_word) crops up a few times, with slight changes. The intent is still there though - basically, get the mask, go through colour planes to see whether to set or not that plane and do it.

Again for the first word and then onto drawing the bulk of the line. This is quite well explained in the code so I won't bother here. Again, a familiar lsr-ing of the colour is done to see which planes to set. And then for the last word it's basically do_line_1st_word again.

Note that in the special case of 19 words being drawn we don't need to see if there are any more words to do since there can't be so we exit.

Well, that's about it. Fairly fast, though it can get faster as I've explained here. This'll be my next task, and I can see it speeding up things quite a bit.

Have fun with the code, hope you like it. Again, if you've got any questions, comments, whatever then email me at gjones@cs.man.ac.uk

; Scanline drawing routine

```
;
; by G. Jones (email: gjones@cs.man.ac.uk)
; 22nd April 1996
;
; This is the fastest scanline drawing routine I can come up with, it's
; easily as fast as many commercial products and on an 8.14 Mhz ST you
; can draw ~122 full scanlines, assuming no time is needed for calling the
; routine or stuff like that. (ie the routine running over and over again,
; with no time for anything else).
;
; If you've got any comments or questions feel free to email me, especially
; if you can make any improvements on its speed!
;
; Set your tab size to 4 or it'll look silly!
;

*******************************************************************************
*
; This routine is very fast! To draw one scanline takes ~1340 cycles. This
; means that if the cycles needed to set up registers, etc and call the
```

```
; routine is ignored, and this routine was just run again and again, you
; could draw ~121 scanlines in 1 vbl. Pretty neat.
;
; Drawing a horizontal line-
; 1. Line length is (16 - (start x position AND $000f)) or less
;        1a. Draw the word from mask table
; 2. Line length is longer:
;        2a. Draw starting word from mask table
;        2b. Fill in (if any) whole words along line
;        2c. Draw final word (if one) from mask table
;
; d0=start x position, d1=scanline, d2=length of line (ie number of pixels)
; d3=colour (ie 0-15), a0->scanline table, a1->mask table
; Uses d4-d7,a2-a3
; Preserves d3,a0,a1
do_line

do_line_words
; This next bit uses a bit of self-modifying code. This is to make the
; routine as fast as possible and is the only way of getting the sort of
; speed I've got out of the scanline drawing routine. Basically, there is
; a part which moves d4,d5,d6,d7 into (a2)+, ie draws on the screen. d4 is
; plane 1, d5 plane 2, etc. Since we're filling whole words, d4-d7 are
; either going to be $ffff or $0000 depending on whether that bitplane
; requires setting or not. The routine beforehand simply sets up d4-d7 to
; hold the right value. This is really the same as what has gone before,
; but we are setting registers not the screen directly.
;
; There is a little more to it of course - if we did this as it stands the
; routine would always draw 19-word lines (ie 19*16 pixel length lines). So,
; the routine at do_line_words_run (which is what draws the line from d4-d7)
; must be changed somehow so that it ends at the right point and then goes
; onto the final word. This is done by pointing a3 to the address of the
; end of the routine (dlwr_restore) and placing a jmp (a3) at the right
; point in the do_line_words_run routine. This is the code modifying itself
; and the hate of professional programmers. It's nothing special, and
; should be thought of in the same way you set up registers, etc for a
; routine, except in this case we're setting the code up instead. Same
; principle, just got to be a bit more careful.
;
; That would be it, except that we need to restore the code we've changed
; afterwards so it's back to normal for the next run of the routine. This
; is achieved by saving the offset into the do_line_words_run where we
```

```
; placed the jmp (a3) and putting a move.w d4,(a2)+ there instead.
; Registers are running short so the stack gets used for once. That's about
; it, just make sure we leave a 2-byte space after the do_line_words_run in
; case 19 words need to be filled (then we'd overwrite dlwr_restore which
; is different to move.w d4,(a2)+) and a check put in to see if 19 words
; have been filled, in which case we need to restore a nop instead of a
; move. (A nop is 2-bytes long).
;
; And that's it. Result? A more complex, longer routine but one which is
; about as fast as it'll get. The first routine I did took ~2200 cycles. I
; re-coded it self-modifyingly to get it to 1300 and then realised how I
; could use the self-modifying bit far more efficiently and got it to this
; speed. Almost three times as fast for worst case in a crucial routine.
; Well worth the effort since this is the core of any polygon routine.
;
; There's probably a few cycles that can be saved here and there, but I
; don't think any major savings can be made. Any saving is worth it though,
; even if it's only a couple of cycles - 100 calls to the routine is then
; say 400 cycles, enough to draw an 80 pixel line, or raster a bit of the
; screen, or do some calculations, or...you get the idea. Remember the big
; picture and don't think oh it's only a few cycles. In this sort of thing
; you need all the cycles you can get!

>Magic 4 hyper text documents.
In PROFILE 2 I use the following code which works under MTOS but not tested
under Magic 4:

```
#define WM_ICONIFY34
#define WM_UNICONIFY35
#define WM_ALLICONIFY36
```

When handling your event messages:

```
short xc, yc, wc, hc;

case WM_ICONIFY:
wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_shrinkbox(msg[4], msg[5], msg[6], msg[7], xc, yc, wc, hc);
wind_set(msg[3], WF_ICONIFY, msg[4], msg[5], msg[6], msg[7]);
wptr->iconified = OPEN; /* set a flag to show state of window */
break;
case WM_UNICONIFY:
wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_growbox(xc, yc, wc, hc, msg[4], msg[5], msg[6], msg[7]);
wind_set(msg[3], WF_UNICONIFY, msg[4], msg[5], msg[6], msg[7]);
wptr->iconified = CLOSED; /* set a flag to show state of window */
break;
```

I need some ST fax software
My modem supports FAX Class 1 specifications.
All I could find was Class 2 software, so I would be very happy if someone could send me something usefull (encoded).
Thanks in advance!!!

>Does anybody know how to use this function?
One possible way is to use these 2 functions to turn the mouse cursor on and off. They keep tabs on the cursor state and prevent you making a mistake (ie turning it off when it's already off etc).

```
short no_mouse;

void hide_mouse(void)    /* universal hide mouse */
{
    if (!no_mouse)
    {
        graf_mouse(M_OFF, 0);
        no_mouse = !no_mouse;
    }
}

void show_mouse(void)    /* universal show mouse */
{
    if (no_mouse)
    {
        graf_mouse(M_ON, 0);
        no_mouse = !no_mouse;
    }
}
```

Brian, unless you have some compelling reason to use STiK, I'd

recommend NOS instead for unattended operation on a single-tasking system. It's capable of exiting after a predetermined idle time, thus automatically creating a "dynamic" event - and I'm in the process of writing a complete FIST replacement package. FTP may remain difficult, however. If you can figure that one out, let me know!

Firstly, many thanks to all the helpful ideas people had about my pixel rout. Unfortunately, I still can't get it to work. ;^(

So I put out the challenge - can someone show me how to plot a pixel in TC mode?

I'm setting the TC mode via Vsetmode(), so that isn't a problem.

I know how to do this in vga - it's basically (on a poc that is) you get the offset of the VGA card ($a000), then the 320x200 screen is a linear array after that, and by setting the individual bytes to a value, you set the corresponding pixel to that color.

Is this similar to the way you do it in TC mode on a Falcon?

And how do you retrieve the base address of the video mode.

I think I'm on the right track...

PLease reply both here and e-mail if possible, as my newsfeed is about 4 weeks slow...

Many Thanks,

Karl Meyland.

Hello, I have a small question.

I'm writing a low-level Graphics Library for the Atari-ST version of
the ETH Oberon System (an Operating System). Since the System should run as
an Application under GEM and on every ST-Hardware that was ever made, I based
it completely on VDI at first. But since VDI is too slow, I want to support
at least the ST-Hi resolution directly by writing to the Display memory.

What I need to know is, what is the most portable way of finding out,
if the machine runs in Hi resolution or not?

It would be possible to check for the width & height & number of colors
of the Display through the VDI. But what if there is a graphics Card out there,
which supports a 640x400 monochrome mode? I just wondered if there is any
safer way to do this?

Also I don't think that XBIOS.Getrez() is of any help, because the XBIOS can't
be aware of graphic cards.

thanx, Simi

Why not rely on what people might already have in their machines to
speed video output - like Warp 9 or NVDI etc? Wayne

summary: MPEG2 Audio Decoder
keywords: DSP MPEG2 Audio Falcon
mime-version: 1.0
newsgroups: comp.sys.atari.programmer

I've written an MPEG2 Layer2 Audio decoder for the Falcon.
The program is released under GPL and the current version is 0.4alpha.
Anybody who wants to test it can mail me (noring@lysator.liu.se)
or get it from my homepage (http://www.lysator.liu.se/~noring/DSP.html).

This alpha version of mp2 replays (in realtime) almost every
standard MPEG2 Layer2 44.1kHz Stereo Audio frame (no CRC).

There are two versions of the program. (the Falcon do not support
44.1kHz sound without an (22.5792MHz) external clock)

* mp2e.ttp is the external clock version with high sound quality.
* mp2li.ttp uses linear interpolation for 44.1kHz to 49.17kHz
  conversion (no external clock is needed). This reduces sound
  quality significantly.

To be done:
* mono
* 32kHz and 48kHz
* more bitrates (only 128kbit/sec and 192kbit/sec are tested,
  others might work)
* CRC check

Music can be found at IUMA (the Internet Underground Music Archive)
http://www.iuma.com

Thats exactly what I did up to now. But you need to know that the Oberon
low level Graphics library was of course not designed with the slow VDI in mind.
For example there is no routine to draw a string, only a pattern copy routine,
and every character on the sreen has to be drawn by this routine. So normal
VDI (maybe not NVDI or Warp 9) is just a bit slow for the job on a 8 Mhz ST.
Because I can't expect everyone to have NVDI this doesn't solve the problem.
And also NVDI can never beat directly writing to Display Memory (if one lets
the Blitter aside), because a Trap takes at about 40 cycles or the like
(not including the trap dispatcher).

But anyway, my program would remain perfectly portable on any ST, if I
could properly decide when to use VDI and when not.

Simon

-- English version at the end

Si je me rappelle bien, il existe dans les param𝔽tres du tableau work_out une valeur indiquant si on est sur un 𝔽cran couleur ou monochrome (ce doit 𝔽tre work_out[13], je crois) - en fait, donnant le nombre de couleurs disponibles (𝔽 ne pas confondre avec celle donnant le nombre de couleurs simultan𝔽ment ututilisables). Si on a 𝔽 la fois work_out[0]=639, work_out[1]=399 et work_out[13?]=1 (monochrome), je pense que l'on peut raisonablement supposer que l'on est en ST haute: une carte graphique 𝔽mulant le mode monochrome devrait donner plut𝔽t work_out[13?]=256 ou 32767... un peu comme le mode 640*400 du TT.

--

IIRC, work_out[13] gives the number of colours in which one can choose the colors on the screen (not to be confused with the number of colours you can use in the same time on the screen, which is given by another work_out - for instance, on ST-low: work_out[13]=512 on STF, 4096 on STE but work_out[??]=16 - may be the contrary); if this number is 1, you're in real monochrome - that is ST high on STE/STF, TT-high on TT. I think a graphic card should give another value, like ST-high on TT (not real monochrom
e but duochrome).

Very very nice!! How about writing an encoder as well? I know
this would free up some space on my HD (lots of samples on it).
I have always wondered if this would be possible on a Falcon,
i guess it is:)

It sounds like you are corrupting the handle somehow. Make sure the value set by v_opnvwk() is the same when v_clsvwk() is issued. If the above example does not work then make doubly sure your ints are not 32 bit.

If the above example works but your code does not then it looks like you are on your own. Beware of blit operations, they can easily get out of control.

: the format of ST executables - the disassembled code has a load of jump
: instructions at it's start, now I don't know whether these are real
: instructions, or a data storage area. I haven't done much assembler!

I regularly disassemble software using HiSoft's MON (comes with Devpac). Under mon you can see a memory map (ASCII/Hexadecimal display) as well as the disassembled code. Using these together, it is possible to work our where any data sections are. For example, addresses always are 4 bytes long, the first byte being 0 - very few instructions look like that.

Executable files are split into three sections: code, data and bss. The code section is generally filled only with instructions and comes first in the program (the only problem is, some programmers see fit to jam data into the code section which is really bad practice IMHO ;). The data setion is filled with, err, data.. :) and the bss section is just blank space.

You can find the lengths of these sections by pointing the memory window of the debugger to be 256 bytes before the start of the program. You will see a bunch of long words there - this is the base page of the program. You can find the full format of the base page in most GEMDOS manuals. Atari Compendium has a really good description, as does the Devpac manual (I think Modern Atari System Software does too).

You can get mon to disassemble the thing out to disc - including labels. If the symbol table is missing from the executable (quite normal) then it creates on using the addresses of the symbols.

The worst software to debug is Turbo-C compiler stuff - it's awful! GFA Basic compiled stuff is also completely unreadable. GCC compiled stuff, however, is a dream!

Happy hacking,

James Cox

I never programmed the Falcon blitter (nor the
Falcon...). However I did program the blitter
found in MegaST and STE. The way it accesses
the RAM is on a 4 cycle per word (16 bit) per
cycle; so to move a word it requires 8 cycles
that is 4 cycles per byte. If I remember
correctly the Falcon's blitter runs at 16 MHz (or
8 if one wants); that gives us 4.10^6 per second
i.e. 80 000 bytes per VBL. On top of that the
blitter and the CPU share the same bus to the RAM.
However with a program running in the caches the
68030 could still run (one could make intensive
simple integer computations while blitting); the
RAM bus of STE can be split in the following way:
64 cycles for blitter, 64 for the CPU.

And the only Falcon programmer I know (he wrote
a famous game...) said the blitter is almost useless
(that's different in an STE whose CPU is much
slower).

What does the VDIhandle _function_ do?

I guess you really meant to copy variables re: "ScreenHandle = VDIHandle"

> > > 4) ScreenHandle = v_openvwk(...,&ScreenHandle, ...) /*or whatever
> > >   the function name*/

v_opnvwk() is documented as returning VOID (nothing, rubbish, cr"*).
Unless you are using a customised func called "v_openvwk".

I was referring to the VDIHandle function you were apparently calling in
step 3. Admittedly you probably meant to assign the value of a variable to
another variable.

Fair enough.

How many virtual workstations are you opening? Would the computational overhead of calling graf_handle and v_opnvwk in sequence be any problem compared to calling graf_handle once, and reusing the saved screenhandle on each successive call to v_opnvwk?

I haven't had any bother using the former approach under TOS 1.2 on a Mega ST with about half a dozen.Likewise, on a TOS 3.05 TT with MultiTOS, it appears reaasonably bulletproof up to the mid twenties (24 I think is as far as I tested - it may be more).

newsgroups: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Over the last few years, while writing documentation for custom ST/TT applications I have written, I've needed to describe the various versions of TOS that they (the apps) were designed for.

Up to a few years ago, all versions of TOS were single-tasking, so simply saying TOS x.xx was OK.

With the introduction of MultiTOS, I struck a problem.

Some apps are better suited to a multitasking environment (a background disc formatter/disc copier, for example, that I have written, and will be ready for wide beta/gamma testing soon)

MultiTOS obviously implys a multitasking version of TOS. But how then does one refer to a single-tasking TOS?

Reading the Atari newsgroups, it appears that the default name for it is "single TOS". But that doesn't roll off the tongue quite as well as it could (read: it doesn't quite sound right). I guess that I may have missed a discussion that eventually settled on using "Single TOS".

I have started using the phrase "Mono TOS". Some have even suggested to me that it might be better calling it something else, as it can be confused with "monochrome" TOS. Also, certain persons (PSD in c.s.a.a) would probably be able to come up with a few sharp-tongued rephrasings of "MonoTOS".

"Uni-TOS" is a variant that might have some possibilities. Although that too has possibilities for denigration.

I am therefore looking for ideas on how one can describe a single-tasking
OS version.

So, consider this article as a trawl for ideas to call single tasking TOS.

The blitter in the Atari computers is pretty much useless yes, it can

share the bus or run in hog mode. If you run it in hog mode the blitter uses the whole bus and you're able to do particulary nothing with the CPU at the time. I can't see much use of the blitter but shifting big blocks if you're in bitplane mode. There do exist some tricks where the blitter can be very useful, though but the blitter isn't very fast on moving data, and I must say that I find 480kb/vbi very unlikely to be true. I'm not sure, I have the correct figures, but on an unaccelerated Falcon the blitter isn't capable of moving more than around 50-60kb/vbi from memory to memory.

I don't know what version of pack-ice you are using (this is the
pack-ice by Axe of Delight?) but in my day(circa 1991) it didn't ask you
to specify relocation explicitly...

Anyway, the point is that if the OS loads up a program, then it takes a
whole bunch of addresses as specified in a table at the end of the
image, and adds the load address to them, thus the code will run from
the loaded address.

If you pack the program as a program, then ice pre-pends a
depacker/relocator onto the executable, which depacks the program and
relocates it.

If you pack a datafile which you are going to depack yourself

(including a program that the OS isn't going to load), then there's no point in putting the relocator, or the depacker, on.

The only time I can see where you would not put the relocator code into a program is if the code was position-independent, ie. it is all written using pc-relative instructions.

Hope this answers your question, and that I'm not just ranting on about the wrong thing 8-)

Chris.

Well I use version 2.4 which I understand is the latest (and I guess
lfinal) version of Pack Ice. A depacking routine is supposed to be
available with the packer but it is the source, not a compiled version.
The idea is that programmers depack from within their programs, you can
do this (in STOS) with a number of extensions. To depack to the
MegaDepacker which recognises most, if not all, version of Pack Ice.
Glad to have helped you as well as me with this question Tony :-)

>What/who is/are Bad Mood?

BAD MOOD is the name of an internet project to create DOOM(tm) compatible
game for the Atari Falcon030.
The game is (and will continue to be) FreeWare and full sources are
available.

A couple of minutes ago, I made the v2.02alpha binary and the v1.93alpha
sources available on the WWW/ftp site (see .sig).

BAD MOOD 2.03alpha will let you walk around in the 3D world defined by a
DOOM, DOOM2 or Heretic WADs with fully textured walls, floors and ceilings.
This is all done in Falcon TC mode, so the light effects look a lot better
than in the original.
(There's no texture mapping of the sky yet and the transparent textures are

still opaque (fixed in 2.03alpha).)
Since the original textures are used, you must run this version with a
WAD containing those. If your WAD is less than a couple of megabytes, it is
unlikely to do so.

No sprites, sounds or any kind of game play are available yet.

For further information, see the WWW page.

What you can do is add a Reply-To: header with your e-mail address
to your articles. I think your newsreader (tin) can do that auto-
matically for you. You probably have to set some environment
variable, or add the header to a configuration file. Being a
trn addict myself, I don't know the exact way to do it. The
readers of news.software.readers will surely be ably to help
you.

Hi Waldi
I have had a go at sorting it, I have changed over to Oasis Nos so
that might help, I actualy tried to send an email to stosser@neon and
it arrived in my mailbag, just try a test mail :))
You dont have any Hisoft Basic 2 source while your there do you :))

If anyone has written and I havent replied then its this thats the
problem, i actualy reply to every email i get, if anyone has sent me
any source then it never arrived ?

Cheers.....!ynoT

Hi,

Thanks to the help of different people, I just found It in 2 different
location.
    ftp.imc.exec.nhs.uk/pub/atari
and
    ftp.fu-berlin.de/pub/atari/mint/contrib-package/mdk.new/mint030.zip

I thank them very much.

Ph. CASTELLA

PS: mint030.zip exists on several FTP sites but in general gem.sys has
been removed from the archive like in FTP.CNAM.FR

Elias Martenson wrote:

> If i remember correctly, there is no floating point support in Sozobon.The docs
with sozlib15 say:
"The standard library modules are to find in the files 'libc.a' and
'libextra.a'. The last one contains rarely used functions and extensions to
the C standard library. With this release 'libc.a' contains all floating
point code, too."
and:
"libm.a The Mathematics Floating Point Library...The library itself is a
port of the 'pml' - portable math library by Fred Fish."
Unfortunately Andrew Thackrah is correct, this seems to be missing from the
distribution. Earlier versions of SozobonX should include it. I have not
investigated far enough to know whether it is still necessary.

   I tried sending you email awhile back before I went on vacation and it just bounced.

   I scanned through the Programming section on a.a.u.e and only found the following:

rez_rgb.asc   5   Document further detailing Hisoft Basic res calls

   Guess I didn't note them as well as I thought. Try Hensa, I believe I saw some there. I know there are a few more files floating around the net. But when you are doing a brief description sometimes extra info like this gets lost. You could try looking at the GFA Basic code there is quite a big section of it at a.a.u.e. under Programming/Gfa. Alot of it should be pretty generic and compatible with HiSoft.

Hello peeps

My email adress is stosser@airtime.co.uk
Its in my signiture as well ? :))

If anyone has any hisoft basic source code for me to load, examine and learn from then please do send, plus any ASCII files on the subject language,

Yes your probably sick of seeing me ask, well having not recieved one single piece of source then my need is still there and I firmly beliecve there must be someone out there that can send me source,
I have spent the last few years sending STOS source and help to many peeps, surely someone in the Hisoft community has the same outlook,
I need help, and am asking,
But no one is responding,

Hmmmm <?>

Cheers.....!ynoT

That's because your ISP's mailer, after failing to find a machine
called "neon" will try again after appending ".airtime.co.uk" to
it. No-one else's system would find it, as they wouldn't try
appending ".airtime.co.uk"

Chris,
I found a WAD for the Bad Mood program on ftp.cnam.fr. It is
in the same directory as Bad Mood and is called damned. I forgot
what compression it uses.... I think it may be arj. Arj is
also available on ftp.cnam.fr, I believe. Damned is a fairly
small file so it shouldn't take long to download. Hope you
enjoy it and this helps ;-).

The STOS EXTRA extension version 3.21 has been released as shareware. I
am posting it to this news group... I know it is a binary but there is
no alt.binaries.atari - if you don't want it, don't down load it.

Check it out, if you like it you may want to register! (Compiler part
not included). Examples and images are provided on the full version
available from any decent PD library soon!

MagiC appears correct having it defined as 90 (with msg[3] containing
the child process ID and msg[4] the child's exit code).

Hi there

Johan Klockars (d8klojo@dtek.chalmers.se) wrote:
: Since the original textures are used, you must run this version with a
: WAD containing those. If your WAD is less than a couple of megabytes, it is
: unlikely to do so.

Where is a good ftp site that has a directory clearly identified for the

IWAD files (as I think they are called). I've wasted a lot of $ on ftp grabbing of PWAD files that don't work with 2.02alpha. Sadly none of the places I know about describe whether or not the wad files on them are PWAD or IWAD type...:-(

BTW, the whole project is lookin' like its cookin'!!! Great stuff guys...

>enjoy it and this helps ;-).

If it is 'fairly small' then it probably doesn't work with any
of the newer versions of Bad Mood. From 1.93 (now at 2.03) onwards
it required an IWAD. This is because the floor (both) and wall
(version 2.x) textures are read from the WAD file. Most WADs that
are small are just PWADs, and only contain map data - no textures
or sounds etc.

But it should work with the earlier versions (eg. 1.92 I believe
texture-mapped with only the built in textures, and ignored any
in the WAD).

IWAD's (as required by 2.x etc) are BIG. You can either install
Doom/Heretic etc. onto a PC (or Mac), and use ARJ to split it up
into multiple disks. Alternatively, you can download the .tar.gz
Doom WAD intended for the Unix ports. (this will still need

splitting onto multiple disks of you need to move it, but doesn't
require access to a PC)

Hope this is of some help...

Anthony

> If it is, how can it be done?

There is no portable way to call C++ methods directly from C. It may be

possible to do so if you're willing to be tied to a specific compiler and a lot of ugliness. Do you have any control over the C++ code? If so, you can generate some functions that are callable from C but are written in C++. These function's can't be member functions, but they can call C++ member functions. Here is the basic idea:

```
---- SomeClass_c.h ----
typedef void* SomeClassInstance;

#ifdef __cplusplus
extern "C"
{
#endif
   SomeClassInstance SomeClass_New();
   void SomeClass_Delete(SomeClassInstance instance);
   void SomeClass_Function1(SomeClassInstance instance);
   int SomeClass_Function2(SomeClassInstance instance,  float x);
#ifdef __cplusplus
};
#endif
---- end SomeClass_c.h ----

---- SomeClass_cpp.h ----
class SomeClass
{
public:
   SomeClass();
   virtual ~SomeClass();
   virtual void Function1();
   virtual int Function2(float x);
};
---- end SomeClass_cpp.h ----

---- SomeClass.cpp ----
#include "SomeClass_c.h"
#include "SomeClass_cpp.h"

SomeClassInstance SomeClass_New()
{
   return new SomeClass;
};

void SomeClass_Delete(SomeClassInstance instance)
{
   SomeClass* me = (SomeClass*) instance;
   delete me;
}

void SomeClass_Function1(SomeClassInstance instance)
{
   SomeClass* me = (SomeClass*) instance;
   me->Function1();
```

```
}

int SomeClass_Function2(SomeClassInstance instance,  float x)
{
   SomeClass* me = (SomeClass*) instance;
   return me->Function2(x);
}
---- end SomeClass.cpp ----
```

The file SomeClass_c.h is a header file that can be used with either a C compiler or a C++ compiler. It defines an interface using purely C style calling conventions. The implementation of that interface (SomeClass.cpp) is C++ code that forwards everything to operations on a C++ class. I don't show the implementation of the actual class SomeClass; it can be whatever you want.

Hope this helps,

Jim Lloyd

Off the top of my head:
It supports iconify
Significantly faster than 4.0
Doesn't crash as much :-)
Change fonts for Desktop windows (or did 4.0 do that?)
erm...
I think there's something else but can't think of it ATM...

Here's a thought:

Why hasn't anyone rewritten STZIP so that the compression routines are moved into the DSP? Does anyone know if this would help, or if it's possible? It sure would be fun to have a DSP STZIP version :)

Can any one help?

Whenever I run Magic 4 on my TT the system clock is moved back 2 years, ie from 1996 to 1994. This only happens on first boot up. So naturally I put the clock back to the correct date. However when I exit Magic using the Shutdown option and selecting cold boot, the clock is then advanced 2 years, so I end up with the clock set to 1998!!!

Has anyone else experienced this problem. More to the point has anyone cured this problem.

This is the only problem I have experienced with Magic 4, I even have GFA Basic working (set to single tasking but....).

Thanks in advance for any help.

Someone recently posted a question here about how to read
the Jag Pads on a STE or FALCON in GFA-BASIC. Well, here
is how I do it on my falcon (maybe there are better ways):

```
' -------- Get both Jag-Pads ------------
PROCEDURE jaguarpads
  '
  SDPOKE &HFFFF9202,&HFFEE
  pad1_a%=255-PEEK(&HFFF9201) AND 8
  pad2_a%=255-PEEK(&HFFF9201) AND 2
  '
  SDPOKE &HFFFF9202,&HFFDD

Huh? I thought it was just an entry in the DESKTOP drop down menus.
I'm positive that I did have other fonts in my desktop windows, but
since I didn't find any suitable fonts for this purpose, I reverted to
the original system font.

Let's start of right. I'm no programmer.
One of the authors of MagiC said that MagX!boot looks for "fastram_valid" when it loads. I think he use the expression $5??. I assume $5?? means where ever the _FRB cookie is located. According to a sys info file I have, the _FRB in my Falcon sits at 0x5f465242 _FRB 0x00036028. I looked through the Atari Compendium and checked all the memory values and magic words that should be present if the system has fast ram installed. I used BSS Debug to do this (very nice, I wish I could program :).
I checked memvalid, memcntlr, phystop, memval2, membot, memtop and other locations that were to have magic numbers if the ram was valid. Everything seem to be in order. I have no problems loading applications into fast ram under TOS, and once MagiC is booted, can load applications from there as well. But I can't get MagiC to load into fast ram at startup.
The fast ram on my Falcon is on a Mighty Sonic card. The amount of fast ram gets loaded into the system with a program that calls itself a VDI patch. This patch installs the FRB and adds the amount of ram on the card to the system. It is a seperate ram from ST ram, but apears on the desktop as one number. It can be ran from the desktop or in the autofolder. I usually run it from the auto so NVDI and such loads into fast ram. I placed it ahead of MagXboot! when I tried to get it into fast ram so the flags were there. Yes, the program flags of MagXboot were set as well.
I would guess
that alternate ram on the FX card is handled in a like way, except I think that the FX ram is managed by routines burned into eproms, but Expose and Outside have the same problems with both types of cards so I figure it is implimented the same.

If MagiC cannot load into systems with this arrangement of fast

ram, it would be a great oversite. As well as the Might Sonic,
the FX, Magmum, Speed Resoluition, Afterburner and Hawk 030
will manage the alternate ram in a simular fashion.
Might just as well go buy a TT.

Or am I just missing something simple ? :)

Mike

From how I underswtand you, you're looking for a way, to use the Fast-RAM of the Mighty Sonic together with MagiC 4, right ?
Thats pretty simple:
Place FAFA*.PRG in front of MAGXBOOT.PRG in your AUTO-folder, so MAGXBOOT.PRG gets loaded into Fast-RAM. To be able to use the Fast-RAM under MagiC, you have to execute FAFA*.PRG after MAGXBOOT again, so that MagiC recognizes the Fast-RAM. The easiest way to do this, is to create a file called AUTOEXEC.BAT (stupid DOS-Name :-( ) in your AUTO-folder, in which you list all the AUTO-folder-PRGS that should be executed after MAGXBOOT.PRG gets loaded.
That's all!!!!

Frank

I just upgraded my Mega 4 to TOS 1.4 and now several of my programs
don't run. I've heard that there is a patch that corrects this.
Also, is there a patch that will alow a hard drive with parity to
run on an old ICD scsi controler without parity?

If you know where I can get these patches please tell me.
Thanks in advance,
Rick

JV Enterprises has released to FREEWARE a modified version of the Towers II
2D/3D True Color Engine. It is designed for use with GFA, but can be
used by C and Assembly.

Can be found at:
ftp.cnam.fr

in:
pub/Atari/Falcon/Programming/falc_eng.zip

If it is not in there yet, please allow a couple of days, as it can take
a little time before it is moved over to the correct section....

Hi There...

I have doom2.wad (14 meg registered version) and heretic1.wad (shareware
version) running with BM 2.05a.

Impressions are _very_ good. In fact excellent. The subtlety of the
shading makes PC native versions look bland IMHO. Keep it up BM team!! :-))

BTW, does anyone know of any enhanced IWAD files other than the originals
and where to score 'em?

Ciao,

Chris W

Anyone here using X-Debug?

The reason I ask is that i've bought a second hand copy to use on my TT, and everything works great bar one problem so far.

It works on my Matrix graphics card fine, providing when it boots that I limit it to 2 colour mode and don't try too use any more!!

Obviously this is better than MON.PRG which writes directly to the TT video out (resulting in a need to leave a monitor connected there) but I would like to be able to run it in more than 2 colours without it corrupting the screen display.

Any help or suggestions appreciated.

Spencer

I can use that menu, but it isn't much use because the desktop seems to get all of the characters wrong using anything but the installed system font (why is this?).Is your problem simply that the dialogue starts off with the "Desktop" button pressed and there is no fonts to change on the desktop? Try

pressing the "Window" button to change the window parameters, the list should then be selectable. If this doesn't work, have you got GDOS installed?

>development) and other shareware efforts in development.

AES 4.1 was pirated by someone and is now used by a lot of people.
It has also very lousy multitasking capabilities. Feels like using
Windows 3.1.

There is another one however called oAESis that you forgot to mention.
It is not finished yet, byt it multitasks very well. (for example, it
updates the windows even while in the menus!)

Hi!

Is there a FAQ somewhere to assist those using Lattice C
(5.6) for GEM programming? My Falcon cheerfully displays
two bombs when it returns from evnt_multi after receiving
a MU_MESAG, and I'm running out of things to "fix".

The Lattice documentation for the Mon debugger gleefully
points out that two bombs represent a "bus error" and
"The causes of the above exceptions (and how best to recover
from them) are given a the end of this section" (Page 212),
yet no such cause-and-recovery information is listed.

<sigh>

[I never got stuck this bad with Mark Williams C <grumbles>.]

Any sources you could recommend for help (other than the
Atari Compendium, which I have) would be appreciated!

This dialogue handles both the desktop style/colour, and the window style/colour. There are a pair of radio buttons to select which is being altered. Make sure the "window" button is selected, because the desktop doesn't recognise font changes, so the popup is greyed out.

Cheers,

Xav

It's multitasking capabilities are infinitely better than the released MTOS AES! Where can I get an alternative to try (even a Beta)? Any Web pagaes out there?

> There is another one however called oAESis that you forgot to mention.

Hmmm, I experienced clock problems but they were more to do with the time
drifting a couple of hours and eventually drifting a couple of days.

This was a battery problem and was cured by my using a Forget Me Clock II
which I used to use on an ST. Beyond that I have had no other problems.

 p> This is the only problem I have experienced with Magic 4, I even
 p> have GFA Basic working (set to single tasking but....).
I've also got Protext running fine under Magic (again single task mode,
but....)

For years, I have used the following code for evnt_multi() with MWC,
you should have no problems with it under Lattice ...

You will have to replace stdtypes.h and gem.h with
something else.

```
------------------------ the header ------------------------

#ifndef  EVNT_H
#define  EVNT_H   EVNT_H

#include <stdtypes.h>
#include <aesbind.h>

typedef struct     {
int  evm_event;    /* required events */
int  evm_clicks;   /* required number of clicks (usually 1) */
int  evm_button;   /* required button (1==left,2==right) */
int  evm_bstate;   /* required state (0==up,1==down) */
int  evm_m1io; /* 0 == into, 1 == outof, (default into) */
Rect evm_m1;       /* default, all set to 1 */
int  evm_m2io; /* default outof */
Rect evm_m2;       /* default, all set to 1 */
int  *evm_msg;
ulong    evm_time;
int  evm_mousex;
int  evm_mousey;
int  evm_mbutton;
int  evm_kstate;
int  evm_keycode;
int  evm_clicked;
}    EVM;

int  Evnt_Multi(/* EVM *m; bool init_flg; int *msgbuf */);
```

```
#endif   /* EVNT_H */

---------------------------- the code -----------------------

#include <gem.h>
#include "evnt.h"

int
Evnt_Multi(m,init_flg,msgbuf)
EVM  *m;
bool init_flg;
int  *msgbuf;
{
 if (init_flg)    {
     /* never wrote any code where this is not enabled so enable! */
     m->evm_event = MU_MESAG;

     /* double mouse clicks can be had */
     m->evm_clicks = 2;

     /* default left button */
     m->evm_button = 1;

     /* down */
     m->evm_bstate = 3;

     /* default into */
     m->evm_m1io = 0;
     m->evm_m1.x = m->evm_m1.y = m->evm_m1.w = m->evm_m1.h = 1;

     /* default outof */
     m->evm_m2io = 1;
     m->evm_m2.x = m->evm_m2.y = m->evm_m2.w = m->evm_m2.h = 1;

     /* message buffer, never needed to but may need a larger */
     /* one some day which it is not built in */
     m->evm_msg = msgbuf;

     /* why mess with two ints? */
     m->evm_time = 0;

     /* nowt happened */
     return 0;
 }

 /* stupidity check! */
 if (m->evm_msg == NULL)    {
     form_alert(1,"[3][Evnt_Multi()|Not initialised][Fatal]");
     return 0;
 }

 /* the call */
```

```
 return evnt_multi(
         m->evm_event,
         m->evm_clicks, m->evm_button, m->evm_bstate,
         m->evm_m1io, m->evm_m1, m->evm_m2io, m->evm_m2,
         m->evm_msg,
         (uint)(m->evm_time & 0xffff), (uint)(m->evm_time >> 16),
         &m->evm_mousex, &m->evm_mousey, &m->evm_mbutton,
         &m->evm_kstate, &m->evm_keycode,
         &m->evm_clicked
         )
 ;
}
```

---------- the example ----------

```
static EVM    evm;
static int    msg[8];
static uint   events;

main()
{
 /* mundane "anticrash" initialisation and MU_MESAG enable */
 Evnt_Multi(&evm,TRUE,msg);

 /* let's say you want the timer as well */
 evm.evm_event |= MU_TIMER;
 evm.evm_time = 1000;

 ...

 while (!done)     {
     events = Evnt_Multi(&evm,FALSE);

     if (events & MU_MESAG)  Hndl_MESAG();
     if (events & MU_TIMER)  /* etc */
 }
}
```

You'll also have to change all the int references to short of course.

Hope it helps :-)

Ok, I gave it a shot. I get the same results. A famous programmer, (thanks for the help, I haven't had time to reply, went to Sac Expo) helped me with an alternative program to FAFA13.Prg to load MagiC into fast ram. The program works as it should, but MagiC still does not load into the alternate ram. The pointers and numbers are there, MagX!boot or MagiC just dosen't use them at the time MagiC installes itself boot up.
At this point I think that either MagiC or MagX!boot will have to be patched to "see" the fast ram in a TOS 4.04 system, something that I am unable to do.

Mike

AES 4.1 (with a decent copy of MiNT) was actually not bad. Pity they never
finished it. Very tight in 4Mbs though.

:-)

Roland.

Yes, they are better, but not good. It's just like saying that Win95
is good simply because it's better than Win31! There are several grades
of lousyness.

>> There is another one however called oAESis that you forgot to mention.

The latest version should be available from:
http://www.dtek.chalmers.se/~d2cg/oaesis/

But beware! It's very much beta (or even alpha still, but it's getting there!)

Depends on preference, mostly. The former would be easier to program, since it would largely be static, but management after the fact would be more difficult, since you'd have to keep track of, and add new, variables as they're added to new versions of the program. The latter would be more complicated to program, but would be easier to manage once it's done, since you wouldn't have to concern yourself with adding new variables; your routine would simply loop until it's done. You could probably keep your config variables stored in an array of whatever is appropriate. The main problem I could see with that however, is mixing variable types. You could have a loop that deals with any type, reading in the parsed data raw and then sorting it out later in your program, but that would make it larger and slightly unwieldy when it comes to the routine that would have to piece together the raw bytes of a char array from your config array. Any char arrays in your config file would also have to be terminated in some form so that you could keep track of where, say, that char array begins, and the next variable, which may be an int, begins.

Personally, I'd go for the first method. The slightly more difficult management of the variables would be much easier than the extended amount of code you'd have to write to handle the second method.

I have been wondering about two difficulties I have in C and would
appreciate anyones views on them.

The first one involves processing config files. What I want to do is write
a config file parser which is as generic as possible. I can see two ways of
doing this though one is more generic than the other.

One way I can see is to define variables of suitable types, load my config
file, parse it and load the relevant values into their relevant variables.
Now this will rely on my having previously setup suitable variables so is
pretty much tied to the application. Though this is easiest to setup/use.

The other way would be to malloc a memory area, load and parse the file and
then load the setting=value in, possibly using an array of pointers to
provide an easy reference to each item.

Which, if either, would people suggest is better or do you have a better
idea?

The other regards error handling. Some people have suggested that I write a

generic error handling function which is passed various parameters such as the function reporting the error, etc and then display a formatted dialog giving the error condition, trying to recover if its one predefined, writing a log file entry.

This seems good in theory but is possibly open to problems. So does anyone have any suggestions to make regards error handling in C.

Sorry for these stupid questions but as I am only really learning C I would like to get the procedures and approach correct from the start.

Hi there you German friend's.

I was wondering if someone of you Atari owners could help me. The thing is that few years back I was a owner of an Atari ST computer and owned a EPROM programmer form a German company called MAXON the name of the programmer is JUNIOR PROMMER. Now I miss using it desperately because it is an outstanding programmer for EPROM's and the Atari software was very good.

Now what I want to ask you is do you know if this piece of hardware could be used with either a DOS/windows machine or a Apple MAC.

I think at the time this was marketed for few other computer

brands.

Please respond to my Email address if somebody knows or have
solved this problem.

It almost seem worth buying an Atari for this.

With Thanks In Advance:

Hello,

I use SozobonX C as C compiler. But the problem is that it hasn't got
all VDI functions.

- vst_arbpt (...)
- vst_skew (...)

These functions are used for handling GDOS.
Could someone give me the following informations :

- VDI function numbers for CONTROL
- the parameters for INTIN and ADDRIN
for these two functions

SozobonX C allow people to add new VDI functions
thanks to C_VDI(BP) where BP is an array of pointers on
CONTROL, INTIN, INTOUT, ADDRIN and ADDROUT.

I need these informations coz I want to compile the Enhanced Gem lib
(E_GEM220) for SozobonX.
These two functions are the only one I couldn't translate.

Thanks in advance.

I'm just finishing off my routines. The line-drawing rout is very fast
now, just need to finish and tune and bresenham algorithm. My computer

science course comes in useful for once! I'll post the source as soon
as I finish the code. It's assembler, fully commented and should be
very fast. Draws polygons in any of the sixteen colours, low-res
only, super speed.

I've downloaded the www_latest.zip file from toad's Archives and
I believe have STiK working correctly. The problem is that CAB won't
display anything. It'll say Resolving, then it stops and up comes a grey
screen with nothing on it. Is this because I have sometihing in CAB not
set up correctly, or is it STiK?
I don't think it's STiK because that will go through the script
fine and say 'Connected' then disappear like it's suppose to. I just
can't seem to get CAB to display anything but grey, and it seems to
actually connect and everything. Any help would be greatly appreciated.

How about malloc-ing a memory area (use an array of structures, or a linked list)
and passing a reference (the array pointer or first item pointer) to your generic
parsing procedure. The parsing procedure could then run through your configuration
file and assign the values. Thinking about it, the easiest method would be to
malloc an array and set the last structure in the array to have a string of "",
indicating the end of the array.

e.g.

```
typedef struct _config
{
```

```
    char *setting_name;   /*pointer to "setting=" string */
    char *setting_value;  /*pointer to result, assigned by parsing procedure*/
}config_struct;
```

Finally, you could write a clean-up procedure that frees the setting_value string's memory and then frees the config_struct array after you have finished with it.

I'm sure this idea could be improved upon, but is it any help?

Recheck the NAMESERVER= parameter in STiK. It *must* be set to correctly address the domain name server (DNS) that you Internet Provider specifies. It should look something like 'NAMESERVER = xxx.xxx.xxx.xxx'. Also check that the file DOMAIN.TXT has some lines in it that have these dotted addresses along with some text that matches the URL that you are looking for. Also, check in the comp.sys.atari.st newsgroup for more info.

I forgot to mention, assign the setting_name values before passing it to the parsing function, that was the whole point of my suggestion. Less programming but all the flexibility of you "generic" idea.

Hi folks,

We have a slight problem with part of the WWW117 package. We really
need someone to translate the English help files into German so the
package is complete.

The important part are the three help files. Ideally three resource
files need translating also but this is not essential because the
translated help files can explain what the options do.

The translation required is not particularly technical and we estimate
it would take between 1 to 3 hours. You will of course get a mention!

Would some kind soul care to volunteer to help us? :-)

How are you compiling it?

32 or 16-bit int?
Stack or register passing?
base-relative or absolute data?

The code can, sometimes, have bugs in it if you take good, "clean" code
written for one compiler and re-compile for another. Assumptions about the
number of free regs, int size and so forth are the biggies.

I have never had any probs with it under
1) 16-bit, stack, base rel
2) 16-bit, stack, absolute

3) 32-bit, stack, base-rel
4) 32-bit, stack, absolute

Have you altered any options within the project dialog? This was one of my big problems when I upgraded from 5.0 to 5.6 a couple of years ago. The lesson I learned was : Set your compile options from the drop down menu at the top of the screen - NOT from the Project dialog.

[snip - GH's source to sample evnt_multi wrapper]

> You'll also have to change all the int references to short of course.

Not necessary. The Lattice libs can cope. Most (if not all) prototypes in aes.h are defined in terms of "int" - which can be either 16 or 32 bit - rather than a more logical 16-bit to match the underlying system interface. To overcome this, you get a different set of libs for each way you can compile.

I guess, I'd prefer a linked list, as it's more flexible. Encapsulating
the list in a pakage would make it easier to use in different appliations.

Inside the package, the (private) specs might look like:

```
struct conf_var {
     struct conf_var    *next;
     char      *name;
     char      *value;
};
struct conf_lst {
     struct conf_var    *head;
     struct conf_var    *tail;
};
struct config {
     struct config *next;
     struct conf_lst    *list;
     void (*delete)(struct config *);
     int  (*write)(const struct config *, const char *filename);
     int  (*read)(const struct config *, const char *filename);
     int  (*get)(const struct config *, const char *name, const char **value);
     int  (*set)(const struct config *, const char *name, const char *value);
};
typedef struct config CONFIG;
CONFIG *new_CONFIG(void);
```

The (public) specs as exported in a header might be:

```
struct conf_priv;
struct config {
     const struct config    *next;
     const struct conf_priv *const private;
     void (*const delete)(const struct config *);
     int  (*const write)(const struct config *, const char *filename);
     int  (*const read)(const struct config *, const char *filename);
     int  (*const get)(const struct config *, const char *name, const char
**value);
     int  (*const set)(const struct config *, const char *name, const char *value);
};
typedef struct config CONFIG;
CONFIG *new_CONFIG(void);
```

Out of the ether, the following was mentioned by diehl@io.org...:

 d> unwieldy when it comes to the routine that would have to piece
 d> together the raw bytes of a char array from your config array. Any
 d> char arrays in your config file would also have to be terminated in
 d> some form so that you could keep track of where, say, that char array
 d> begins, and the next variable, which may be an int, begins.
 d> Personally, I'd go for the first method. The slightly more
 d> difficult management of the variables would be much easier than the
 d> extended amount of code you'd have to write to handle the second
 d> method.
Agreed.

However I want to start writing routines to handle various common tasks which have defined I/O's and can be linked in when needed so my second approach would be better in this circumstance (though not as easy to perform, agree

All entries will have a pointer assigned to first item and be null terminated so dealing with them shouldn't be a problem. Also all pointers will be stored in an array for reference which should make dealing with the actual entries easier.

So the routine will say accept just the path/filename of the config file. Parse it and load the valid variables into the malloc'd block setting pointers and null terminating as it goes. It will then return a pointer to the malloc'd block (plus possibly its size, i'm unsure of making the block size set because of the uncertainty of the amount of variables that may be processed) and a pointer to the array of pointers. The calling program then just obtains the pointers and possibly malloc'd blocks size and goes it merry way using them as needed.

Now I realise this doesn't make actual handling of different types any easier but someone else (thanks Jaap) has suggested using the likes of atoi to convert settings where needed into values other than char.

Allthough definately more complicated than need be such an approach would provide an infintely more generic routine, of much more use for future programs and taking that next step on the road to professionality! ;-)

Spencer

Until further notice NeST node 90:90/0.0@nest.ftn (the main NeST Node)
is offline.

I suspect the power supply on the Mega ST4 has blown once again.

Roger Cain (90:100/103) will be visiting tomorrow night to hopefully
effect repairs.

Normal service will be resumed as soon as is possible.

Daron Brewood - NeST Zone coordinator.

Even if you do think this is a problem of CAB it normaly is a problem
with STiK and your account.
At the moment STiK only supports SLIP access, no compressed SLIP
(CSLIP) or PPP protocol.
So check out if your provider has set the right protocol for you.

BTW: If your provider does not provide pure SLIP access, stay tuned. I
know that there is done much work to STiK and that there will be a new
release with CSLIP or PPP (maybe both) in it.

Bye,
  Michael Guse

It does work, if the address for the RSC file is set in the global array...

I don't know of any, but there is some hope in that the author of UDO is
'looking' at adding some reverse conversion modules (UDO converts UDO files
into several formats including STG HYPs) and RTF to UDO is one of them.

I don't know how helpful this would be, but a book on the 68000 by Lance
Leventhal (from around 1980, I think) contains a table with the
instruction set and all the machine language equivalents. I could
probably find it at the library and get you a photocopy of those few pages...

(When I say machine language equivalents, I mean the patterns of bits
that correspond to each mnemonic... It's tedious to look over, but it
should point you in the right direction, depending on what you intend to do.)

Heh. Heh. And double heh.

Dennis, Britain & the American Colonies only adopted the Gregorian Calendar in 1752. So any date prior to that was on the Julian Calendar. Most of the Catholic nations of Europe adopted the Gregorian calendar imediately, but not us stubborn Brits. How come we're always at the tail end of everything?

And Dennis, up here in Scotland we still have pound notes printed by 3 banks. What's more, they are still legal tender.

I think that makes it 2-0? =:o]

ekallion@cc.Helsinki.FI (Esa J Kallioniemi) writes:

>My advice to you is that if want to code games (with fast graphics) you
>better use only the 256 color mode.

Why do you think most games at the moment do use the high colour mode?

It's faster. To set a pixel in high colour mode you write two bytes, to
set it in 256 colour mode you need to do eight separate bit operations.
Had Atari made a chunky 256 colour mode it would have made much better
speed possible, but as it is high colour is fastest for most things.

I have thought about adding cart emulation, but this will take some time and?
effort to do, and the question is also - Are there any big market for it ??
Will Atari dump the Jaguar ??

Out of the ether, the following was mentioned by mnb20@cam.ac.uk...:

 m> Your code needs to be __saveds and depending which interrupt you may

 m> want to make it __asm so you can get the values passed to you. Apart
 m> from that, just write the address of your routine into the vector. To
 m> go tsr, you quit with Ptermres().
Ok, any sample code???
;-)

 m> That depends what interrupt. It shouldn't be a problem with msot
 m> things. Obviously if you need to do some graphics it's not really
 m> possible as I don't think GEM is re-entrant.
Well looking at the interrupts and other comments I was led to believe that
the best int to use was the VBL which is screen mode specific.

I would like to write an interrupt driven routine which can be a TSR and sit
there polling the comm port waiting for a certain string then do its stuff
once it has been resolved so no graphics involved.

It's only the best interrupt if you really want to do something regularly.
An interrupt triggered by a particular event would be better.

(of course, the only thing that's screen mode specifc about the VBL is its
frequency, which for what you want to use it for is irrelevant anyway)

>I would like to write an interrupt driven routine which can be a TSR and sit
>there polling the comm port waiting for a certain string then do its stuff

I can't remember how to do it now (I don't have any docs with me either) but
it should be possible to hook the rs232 receive vector, so you could do the
processing there, wouldn't that be easier?

I've finally got around to porting my Sinclair QL emulator to the Falcon030.
Unfortunately, there are some problems which I can't do much about with
the documentation I have.
I would prefer not to have to buy Motorola's reference manuals only to
look at a dozen pages or so.
A pointer to some in depth '030 documentation on the net would be much
appreciated.

Now for the problems:

First, the Falcon normally sets up an MMU table between $700 and $800
(at least with my TOS 4.01).
The problem is that the Sinclair QL expects its ROM with the OS to be
positioned at the bottom of memory, so the table must be moved.
But what is the information in that table? And how should the
initialization of the MMU registers be changed?
I know that it would be possible to remap the address space so that the
emulator could run in its own, protected, memory space. To make that work
I'd still need the same information, though.

Second, the QL emulator currently relies on a bus error handler to do a
kind of instruction modify and restart for some of the QDOS calls.

Now, on the '030 the bus error stack has a lot of extra information to
enable the continuation of instructions.
What is that information?

It could be possible to set up appropriate arrays of OBJECT pointers and
TEDINFOs and so forth, and then embed that into the AES global array.

Yes,of course if you kill the mouse things will speed up...But this
isn't the case, person who posted the original message is from pc/mac
platform and it can be kinda hard to start coding games on 16 mhz
machine,especially if you want them to be any good.

: : Just a hard fact : there isn't anything you can do to speed up things
: : apart from using assembler. Falcon is simply terribly slow machine
: : especially in high color mode....And for all the Atari advocates, I have
: Why not use the DSP, after all, what is it there for? Decoration?

Yes, dsp can be used it's just that it won't help you _draw_ polys any
faster...You can calculate things very fast with dsp (something like 1
cycle for mul) but the overall performance will be rather bad because of
the slow video. It's easy to see the effect of the bad video, just plug
slow isa video card on the pentium machine and watch how the things
crawl. Falcon could handle quite well games like wolfenstein 3d and doom
where with carefull optimisation all pixels could only be drawn once.
But the original poster stated that he wanted to write 3d games with
Falcon, and atleast I understand that this means games with polygons.

It doesn't take much of the programmers skills to understand that if you
have to draw polygons with one pixel at the time, on 16 mhz machine with
16-bit bus to the memory the performance can't be that good.

Thanks, but it's not quite what i'm looking for. You see i've written an
ST emulator in 80x86 for my pc and i've now got to the stage of
debugging it and running it through my ST's ROM (it's v1.0). I have been
able to check the opcodes it's processing by using the ST INTERNAL book
by abacus which has a listing of most of the BIOS of ROM. But my
emulator is crashing in the DOS part of ROM which is not in this book.
So what i need is a disassembler i can use on the ROM so i know what the
heck i should be getting....

(P.S. i am well aware that this is in no doubt the most useless method
of debugging a program!).

Thanks, but it's not quite what i'm looking for. You see i've written an
ST emulator in 80x86 for my pc and i've now got to the stage of
debugging it and running it through my ST's ROM (it's v1.0). I have been

able to check the opcodes it's processing by using the ST INTERNAL book
by abacus which has a listing of most of the BIOS of ROM. But my
emulator is crashing in the DOS part of ROM which is not in this book.
So what i need is a disassembler i can use on the ROM so i know what the
heck i should be getting....

(P.S. i am well aware that this is in no doubt the most useless method
of debugging a program!).

Hi all,

I have the following problem:
I want to convert sound files, namely from Windows *.wav to Steinbergs Avalon
*.smp format. I have no problems with all the headers and tails and stuff,
but I couldnt figure out how to convert the data itself.
In the *.wav file each sample word is stored as a signed integer with the LSB
first, i.e
-34268 = &H8000 = 00 80 in the file
+34267 = &H7FFF = FF 7F in the file, and so on.
In the target *.smp I find a unsigned integer with the MSB first:
255 = &H00FF = 00 FF
40215= &H9D17 = 9D 17 etc.

Any hints (GFA-Basic 3.5) would be highly appreciated!!!

Chris

Hello

Is the QL emulator you have ported to the Falcon a software emulator.

As I thought all the Atari emulators were hardware emulation. The best
been the QVME card which slots into the VME bus on the TT and Mega STE. I
suppose if the Falcon had a VME interface then this could possible.

Derek

I can't for the life of me set the video mode on the Falcon. I
start with a Setcreen with the proper mode (gotten from Vsetmode
with -1), a rez of 2 (for 640x480) and then do a Vsetmode. In
640x480x16 I can set the video to the same mode, however from

any other mode it trahes the screen. What am I doing wrong? I
am using assembler.

Nicholas

During the development of a game I'm writing, I seemed to have come
across a strange problem.

I developed a small subroutine in my game whose sole purpose was to set
up and load relevant MOD files to play in-game and at various other
stages (title screen, high score, etc.). I simply passed the name of the
MOD and its size and the routine loaded it into an array. However each
time it did this, it would first eraase the array, and then redimension
it for the required size of the MOD. Now this all seemed to go all very
fine and well. During testing I played the first ten stages of the game,
after which several routines were designed to change the screen backdrop,
tile set (it's a logic/puzzle game) and the in-game music. After level
10, stage two begins with a new backdrop, new music, new tiles, etc, and
everything seems to go fine -- until i click on a tile, at which point
the MOD music just completely screws up.
Now, I solved the problem simply by defining a global constant array
for the size of the largest MOD in the list -- a last ditch attempt that
I didn't think would work -- having decided that redimensioning the array
was pointless anyway. To my surprise, it worked! The music no longer
screwed up when a new MOD was loaded and a tile clicked on.
But my curiosity's got the better of me. Why did the music screw up in
the first place? Is there a bug in the erase() command?

Do you allocate enough video ram?
640x480x256 needs twice the video ram needed for 640x480x16. You can get the
size of a scrren mode with the VgetSize(mode) function, set the new video
ram with Setscreen and then use Vsetmode.
Also another way is Setscreen()L, 0L, 3, mode)

ObAns:
Try VAL(A$). This works in every BASIC I know.

But:
You probably meant to convert binary numbers to normal base-10
integers, didn't you? Well, I don't know whether HBASIC supports
binary numbers, e.g. by means of some prefix. If it does, then you

could simply prepend that prefix to your string and VAL it then. If
not, you'll have to make up some kind of function for it.

Something like (off the top of my head, so no guarantees :-)

```
DEF FN bin2int (a$)      ;or FUNCTION, or whatever HBASIC calls it...
   res = 0
   FOR i = 0 TO LEN(a$) - 1
       res = res + VAL(MID$(a$, LEN(a$) - i, 1))*2**i
   NEXT i
   RETURN res
END FN                   ;of ENDFUNC, or whatever...
```

Something like that.

Regards,

I've got a 68000 disassembler written in C. I can give
it away, but there's no comment and should not be used
in commercial software without my agreement.

Laurent

That's of course possible using almost any programming language.

It isn't obvious that the number in A$ is in binary format, but if we
assume that, a simple pseudo code (Pascal-C-BASIC of sorts) program could be:

```
len = length of A$
num = 0
for i = 1 to len        (assuming the string is indexed from 1 to len)
   num = num * 2
   if A$[i] == "1" then
      num = num + 1
   end if
end for
```

Hello I am using MagiCMac, I have a Quadra with a 25mhz 040 and 55mhz DSP,
how come no one is upgrading to 040s they work GREAT with MagiCMac, you
can get a 040 for under $100 (US). I am planning on writing some
rendering software to use the 040 and maybe even my DSP. If wan't LOW 040

and even LOWER 030 prices take a gamder int he bac of a Mac Magazine you
can find MANY great bargins.
Thanks for any ideas
Zan

This is from a reply by Doug Little (he's one of the author of Apex)

Initialisation:

```
        OldModeCode = VSetMode(-1)
        OldPhys = PhysBase()
        OldLog = LogBase()

        VSetScreen(NewPhys,NewLog,-1)
        VSetMode(NewModeCode)
```

Clean exit:

```
        VSetScreen(OldPhys,OldLog,-1)
        VSetMode(OldModeCode)
```

Avoid this at all costs:

```
        VSetScreen(NewPhys,NewLog,NewModeCode)
```

Trying to use VSetScreen with both screen address pointers & resolution flags passed as valid parameters will end in chaos. You have to do both jobs separately.

Doug.

AIUI, if you have NVDI 3 running then you're in big trouble, it doesn't like rez changes much and you're going to have to save and restore the screen registers, and restoring the screen registers is apparently not easy - as *when* you restore them and what order you restore them can be crucial!

BTW after the first VSetScreen you can do another immediately after

```
        VSetScreen(-1,-1,NewModeCode)
```

this helps too.

Maybe NVDI 4 is better!

Good luck :)

Phil

Well I finally got sozobonX to work. I was well happy when Dan is cool started scrolling down the screen (dan is cool is good for any test program message and is a throw back from my speccie days).
Any way.
I'm now looking for several things.
is there an editor which allows several files to be open at once and allows me to chain to the compiler?

Does anybody have or know where I can get documents/ files/ information on GEM programming.

If I wanted to make a file editor which could edit several files at once. How could I store the files in memory. i.e. how could I dynamically change the amount of memory for each file so they can grow in size. Would I give enough for say 10kb per file and then if I needed more I couldmove some of the files about in memory?

Does anybody know where I can get any extra libraries for sozobonX c
does anybody know of an interrupt driven sample player for c which will play a short sample in the background while allowing some processing to continue with my application. (I like funny noises and the like in any program, not just

games.)

oh well I hope I've given you all something to think about.

Yes, it's 100% software.

>As I thought all the Atari emulators were hardware emulation. The best

All the well known ones use hardware, but I didn't have the cash to pay
for one of them back in '89, so I wrote my own...

A handful of people used QLem back then, but until a couple of weeks
ago, I hadn't done anything with the program since '91.

Currently QLem only runs on 68000 based Ataris but, as I wrote, I'm
trying to do something about that.
QLem actually works to some degree under STonX (problems with the bus
error handling) and I'm planning on making it run without the ST ROM
and with its own screen emulation -> A QL on (almost) any UNIX system! :-)

Use realloc(). This makes the typically cryptic 'C' explanations of
realloc() a little clearer ...

```
tmp_ptr = realloc(cur_buf,cur_size + extra);
if (tmp_ptr == NULL)   {
     /* no more memory, cur_buf still valid */

     if (cur_buf == NULL)   /* can't get a buffer */
     else          /* can't extend/shrink buffer */
     }
else {
     /* cur_buf gone */
     /* tmp_ptr contains a copy of cur_buf contents */
     /* plus 'extra' space to use */

     cur_buf = tmp_ptr;
     cur_size += extra;
}
```

You misspelled "32768". :)

> In the target *.smp I find a unsigned integer with the MSB first:
> 255 = &H00FF = 00 FF
> 40215= &H9D17 = 9D 17 etc.
>

Unfortunately I know nothing of GFA Basic, so I'll have to write in C:

```
unsigned char a, c, c;
int i;

for (i=0;i<nbrSamples;++i)
  { a=getchar(); b=getchar(); putchar(b^0x80); putchar(a); }
```

Note that ^ is the C operator for "exclusive or".

Note that 0 for signed samples maps on to 32768 for unsigned:

```
00  80  FF  FF  00  00  FF  7F  ->  00  00  7F  FF  80  00  FF  FF
-32768    -1       0    +32767         0     32767   32768   65535
```

Good luck

Chris

BASIC TEASER
Open to coders of any BASIC Language

*** note that regular users of this echo actualy requested this idea on irc channel #atari 22/02/96, I am simply supplying the question so apologies to anyone who thinks this is wrong, but this channel is desperate for traffic, enjoy ***

(1) You have a dimmed array, TEXT$(2000)

(2) You have loaded a document into this array, with each cell holding a line of text,

(3) You display the text with something like
****

```
    END=NUMBER OF TEXT LINES LOADED :rem this variables holds how
    many lines of text there actualy are, could be 10, could be
    1000
    MARKER=0 : rem this variable holds position of text on screen,
    ie 0=top of doc, END-21 = bottom of doc

    REPEAT
    I$=UPPER$(INKEY$)
    IF I$="F" AND MARKER < END-21 THEN INC MARKER : GOSUB SHOW
    IF I$="B" AND MARKER > 0      THEN DEC MARKER : GOSUB SHOW
    UNTIL FALSE

 SHOW rem sub routine to show 22 lines of text

 DUMMY=MARKER
 CLEAR SCREEN
 FOR N=0 TO 21
 LOCATE 0,N
 PRINT TEXT$(DUMMY)
 INC DUMMY
 NEXT

 REM **** DRAW A BOX X1,Y1 TO X2,Y2 ***************
```

RETURN
****

OK very rough and a pretty unusable routine, but it should be readable to even a beginner at basic,

THE TASK

Make a scrollbar, so the BOX thats REM'D will show the status of the file, This is a set window lentgh of 180 pixels, the amount of text could be 10 lines to 10 000 lines, how would you make a workable scroll bar, not interested in how to draw it, or how to work it, just interested in the correct X1,Y1 AND X2,Y2 coordinates that should be the correct top left and bottom right corners of the box no matter how for into the text you are, ie: what status the MARKER variable is at,

NO RULES but it must be BASIC not C (get your own compo <vbg>)

it is possible, see issue one of FOCUS diskzine and you will see that i have used a perfectly working scrollbar, but it took ages to make, months to figure out, so theres your task :)

Cheers.....!ynoT

> what status the MARKER variable is at,

Let w1 be the pixel width of the 'base 'box and w2 the width
of the 'progress bar'.
w2 = int(w1* (Marker)/(MarkEnd-21)) :rem end can be reserved

x1,y1,y2 of the progress box are the same as the base box.
If w2 is truncated to an integer value, then x2 = x1 + w2% where:
w2% = (x2base-x1)*Marker/(EndMarker-21)

base drawn with x1,y1,x2base,y2 parameters [and hollow]
progress drawn with x1,y1,x2,y2 parameters [and a fill]

exact code depends on your basic.

Relatively simple. All you have to do is turn the number of lines in the text file into a percentage and then determine the positioning of the scroll bar relative to the percentage into the file the user is currently at.

Let's say, for example, the scroll bar is 10 pixels tall, and the window within which the scroll bar sits is 110 pixels -- just to make it easy. That gives the scroll bar 100 possible positions. Now let's say that the text file is 1000 lines long -- also to make it easy. This means that for every pixel the scroll bar is moved up or down, the user will move up or down 10 lines in the text. Therefore, the user would have to allow the text to scroll 10 lines when (s)he clicks on one of the scroll arrows before the scroll bar moves one pixel.

So, if the user dragged the scroll bar down to the middle -- precicely 50 pixels down -- that user would end up with line 479 (500-21 lines of text displayable in the text window) of the text at the top of the window -- or line 500, depending on how you define the top variable and, therefore, the dynamic positioning of the scroll bar. (You could define top as either being line 21 -- or the last line, if the text is smaller than 21 lines -- or as line 1)

I could whip up some code if necessary (in GFA) but here's the explanation of how it's done, anyway. (I had to wrestle with it myself when I wrote Fansi. :-)

Did you bother to do any garbage collection?
Whenever I have that sort of thing it looks like...

```
  ERASE var()
  ~FRE(0)
  DIM var(big)
```

Another thing that trips people up is the fact that GC anywhere may cause your variables to move about, so that

```
  a%=V:var(0)
```

may be valid for a while, but then var() might be moved, and a% points to something else.

:
Use the blitter if you can do 2d blits or full screen blits. Yes you can use the blitter in TC as a replace mode blit ONLY. Set it up as a 1bit blit and work from there. I think I uploaded something to GEnie a while ago that demonstrated blitting on the Falcon.

With blitting, you can increase the performance to up to 12kb/sec in HOG mode.

Tony, Tony, Tony!

Thank you for supplying this teaser. However, I wrote a routine like this a while back, so thought was unnecessary (thank god!)

Here it is:

```
PROCEDURE sidebar
  PBOX 608,18,622,154                        ! Gives a nice white box
  ratio=138/endline%                         ! No of pixels/No of lines
  pagetop%=INT(ratio*(topline%-1))+17        ! Top of white box
  pagebase%=INT(ratio*baseline%)+17          ! Bottom of white box
  IF pagebase00000006agetop%<5
    temp%=INT(ratio*(topline%+10))+17        ! This routine sorted out a
    IF temp%<20                              ! minor bug, but I can't
      temp%=20                               ! remember what. It might be
    ENDIF                                    ! unnecessary. It might be
    pagetop%=temp%-2                         ! pivotal. I should comment my
    pagebase%=temp%+3                        ! code when I write it, & not
  ENDIF                                      ! 3 years later....
  DEFFILL 1,2,2                              ! This is a dotty menubar fill
```

```
  PBOX 607,17,623,pagetop%                  ! Draw the top grey box
  PBOX 607,pagebase%,623,155                ! Draw the bottom grey box
  DEFFILL 0,1                               ! Back to reality
RETURN
```

This is perhaps unconventional in that it draws the two shaded boxes rather than the single white box. There's no particular reason for this, other than the number of DEFFILLS.

I know that the INT commands are largely redundant because I am using integer variables, but I like to write neat code :o)

 I asked ages ago, as there was NO response then I will ask again,

 Has ANYONE got ANY source code i can have for Hisoft BASIC 2 as given
away by Atari World,

 I want to check out the code and find out what the language is capable
of before I go any farthur, Someone must have some source code or know
where I can find some,

 Cheers.....!ynoT

>
> NO RULES but it must be BASIC not C (get your own compo <vbg>)
>

Here is the basic routine written in generic pseudo (personally I use GFA). As window length was stated I created the routine for a horizontal scroll bar, just swap x,y & x1,y1 to make it vertical.

```
PROCEDURE scroll_bar(mlines%,tline%,width%,vlines%)
' parameters
'      mlines = total number of lines loaded
'      tline = top line of current screen
'      width = total width of scrollbar range ( stated as 180 )
'      vlines = total number of lines displayable
LOCAL box_x%,box_y%,box_x1%,box_y1%,a#,scroll_x%,scroll_x1%
  box_x%=0
  box_y%=0
  box_x1%=width
  box_y1%=10  ( just to give it some height )
  a#=(box_x1%-box_x%)/mlines
  scroll_x%=a#*tline%
  scroll_x1%=scroll_x%+(a#*vlines%)
  DEFFILL 1,0                 ( white box black border )
  PBOX box_x%,box_y%,box_x1%,box_y1%
  DEFFILL 1,1                 ( Black Box )
  PBOX scroll_x%,box_y%,scroll_x1%,box_y1%
RETURN
```

Drawing it is a doddle, the challenging part is to move it with the mouse so it stays inside the range bar and can move from one end to the other and feeds the coordinates back. Also clicking on the range bar moving the page in the right direction AND the final part is to update the screen as it goes so that you can watch the text scroll as you move it.

If it is worked well you should be able to move the text cursor on the screen by moving the scrollbar.

I had to write a very small text editor for OASIS <70K but it had to handle any ATARI 16 bit computer with full GEM control with resources, MagiC, the usual word processor functions, block manipulation, Word wrap etc and can handle files of any size (actually the limit is 99,999 lines). It isn't everybodies cup of tea but then no program is.

What I have just finished was really hard - Try writing a multitasking GEM program with full TCP/IP systems (not one that runs in a multitasking environment - but is fully multitasking in itself, Menus Windows & Dialogs). Done in GFA basic.

The language isn't important it's the ideas that use it that are!

I have recently struct a bit of trouble with AES 4.1 listboxes.

If I disable the very last item in a listbox, it comes out in a "disabled button" colour, rather than just greyed text on the background colour.

If I disable any other item in that listbox, it comes out as grey text on whatever the background colour is.

This looks very odd, when the rest of the popup is flagged as FL3DBAK. Each of the affected ones are flagged FL3DBAK as well.

The listbox has fourteen items on it, all of type G_STRING, with four or five of them disabled.

Doing it as a normal popup menu seems to cure it.

Has anyone had any similar experiences like this?

How does one get around it? (other than doing it as a normal popup)

(I am using Lattice C 5.6, MultiTOS AES 4.1, MiNT 1.12 with memory
protection 'on', on a 20Mbyte TT in TT-Medium rez).

: Did you bother to do any garbage collection?
: Whenever I have that sort of thing it looks like...

```
:   ERASE var()
:   ~FRE(0)
:   DIM var(big)
```

I'd forgotten about garbage collection; thing is though, I don't think
that was the problem; the problem recurred at exactly the same place
every time, and in precicely the same way. It was too regular and
precice to be a garbage collection problenn.

: Another thing that trips people up is the fact that GC anywhere may cause your
: variables to move about, so that

```
:   a%=V:var(0)
```

: may be valid for a while, but then var() might be moved, and a% points to
: something else.

I don't think that was it, either, but I'll keep that in mind. I've made
the array static now, so the probem hasn't recurred, and if I run into
more probllems I may just use malloc() instead.

I agree. As we all can see, it's almost impossible to write a game
using real texture mapping on an amiga, just because of the lack of
chunky pixel format (ok, there are some tricks for it like using the
chopper, but they all have their limitations).
IMHO, the 16-bit-mode fits best for games on the falcon. Even if it
means to code in assembler. BTW, there's still a DSP around to do
some of the heavy work...

It seems that you have obvoiusly not seen BAD MOOD for Falcon than - eh ?

Well I can tell you, that it makes all your arguments fall to the grownd, regarding
the Falcon being slow in HighColor and 3D.

Of course, the Falcon is not state of the art anymore, I know that, but anyway check out :

http://rand.thn.htu.se

....and see what's possible on the Falcon.

There is some floating around in the Programming section of a.a.u.e. I
couldn't tell you exactly which ones they are though. I remember seeing a
couple when I was indexing it last year. If you grab the 0index, I think
I noted which ones were HiSoft Basic.

Sorry I can't be of any more help,

keywords: Scrolling
newsgroups: comp.sys.atari.programmer
summary: Scrolling

I'm tring to fix some programs I wrote afew year ago. One problem I
have is I get flicker on my scrolling program. I am using Vsync and Set

screen and coping screens to the buffers can the switch. but every so often get flicker near the top of the screen. This happens on both my STFM and Falcon. I basicly copy the next screen to logical page, vsync then switch logic/physical then do the same for the next screen.

Is there a faster or flicker free way to do this that will work on both systems. I can't think of any other way with the 256byte restriction for screen boundaries on the STFM.

Thanks

John

Tony,

If you are looking to play about with a different flavour of Basic, why not try out GFA? Asides from my obvious bias, it really is a powerful version of basic, and it forces you to write really structured code. Good training for when/if you switch to a 'real' language (as MarkB would say!)

The other advantage of trying GFA 3.6 is the number of people who use it and can give you support & false information in equal measure :o))) Guess which bracket I'd fit into....

Seriously, though, I'm a bit of an amateur, but I know my way around the language. There are a couple of experts floating around. For instance, Oasis & Oasis 2 are written in GFA 3.6, so those two must be a bit handy. And you might have noticed others on this group & c.s.a.s. talking up a good game! :o)

This isn't intended to start a flame war between languages; I just assumed you were interested in other Basics because of your question. I don't know anything about HiSoft.

My opinion, that's all..

Steph.

So does Hisoft Basic though. Either would be better than STOS :)

>Good training for when/if you switch to a 'real' language (as MarkB

Since you mention it, yes :)

I really don't think I should reply to this bit :)

>you were interested in other Basics because of your question. I don't know
>anything about HiSoft.

Hisoft basic is better for GEM stuff, particularly if you have Ofir's toolbox. Apart from that there's not much to choose between them really, it's just whichever you prefer.

Perhaps someone could help me with a couple of GFA problems/queries:

Firstly, I've been having problems getting the VA_START protocol working - specifically in finding the path/file that is passed when a file is dropped onto the program icon.

I get the VA_START message and the appropriate details in the message buffer fine, with the hi and lo words of the address. When I concatenate the two words, it gives me an address, which I can then read with filename$=CHAR{address%}.

This works fine when both numbers are positive, and I get the correct filename. However, recently I have started to get negative numbers in the low word of the address, almost always resulting in a crash (bus error) when reading the file string ('cos it's getting the address wrong). Typically I get values of 25 for the hi word and around -2756 for the low word.

Anyone have more info on this?
(BTW I'm using MagiC 2 and Gemini 1.999)

**

Also, can anyone shed a bit more light on the compiler settings - specifically, which ones should be used and which should not. I'm writing Line-A free MagiC compatible, modern flydial interface Gem apps with Gregor Duchalski's Flydials.

Cheers!

I have a piece of software that drives a piece of hardware attached
to my Atari (it's the Lynex 16 bit sampler if you must know). Now, I
have a problem: The software is very unreliable, and also has features
which I don't use - it also lacks features that I would like. After
(approx) 2 years of searching, I have found no-one who has heard of this
hardware, and no help whatsoever. Which brings me to my question:

Is there a recognised way of `reverse-engineering' the code? I managed
to disassemble the code using GFA assembler, but I don't really understand
the format of ST executables - the disassembled code has a load of jump
instructions at it's start, now I don't know whether these are real
instructions, or a data storage area. I haven't done much assembler!

Any hints, tips etc. (or better still, someone who has some source code
for the Lynex sampler - I still live in hope) will be gratefully
received.

cheers,

john..

I'm having grief with the vdi function "close virtual work station" (I can't remember the C function name off hand). NVDI3 complains that I pass it an invalid handle but I can't see what I'm doing wrong. Here's what I do (important details only):

```
1) call appl_init()
2) VDIhandle = graf_handle()
3) ScreenHandle = VDIHandle()
4) ScreenHandle = v_openvwk(...,&ScreenHandle, ...) /*or whatever
     the function name*/
5) event loop till quit
6) v_closevwk(ScreenHandle)
7) appl_exit()
```

NVDI pops up a dialogue box informing me that I gave it an invalid handle. The documentation I have says that this is the correct way of doing things.

This page has now been updated, Some major changes have been made, the <Downloads> section now has its own menu system, from here you can now download all 25 issues of STOSSER Diskzine, all 4 issues of STESTOSterone diskzine, a selection of STOS extensions and a selection of my titles, including H.E.R.O. Multiplayer Pakman and VidIgrid 2, other titles by myself can also be downloaded,

Couple of more people added to the <Bit about> section, please note anyone in this section directing others to there "bit" should use the normal url but change your name to uppercase,

A new section added on the main menu and smaller updates to existing sections, there now totals Seventy Nine (79) seperate pages on this one site,

This will be the last major monthly change now that I have a working ftp client ie: MG-FTP for use with STiK, I now dont have to wait a month, with my STe I can now update the page as often as I wish, and indeed will be doing, so keep your eye on the date when you visit :)

Cheers.....!ynoT

Sorry to be a bit blunt here, but could you possibly explain a little more clearly exactly what it is you're trying to do since I'm not sure I've understood correctly. I assume that you're just trying to do

double-buffering - ie, display physical screen, draw on logical screen, wait for the vbl, then swap screens. If your code runs in less than 1 vbl, then you can put in a new vbl routine at $70.w:

```
vbl1
     move.w   #1,vbl_flag        ;    flag the vbl's happened
     ...                ;    any other code
     move.l   #phy_screen2,$ffff8200.w    ;    display physical screen
     move.l   #log_screen1,screen    ;    draw on logical
     move.l   #vbl2,$70.w        ;    next vbl
     rte

vbl2
     move.w   #1,vbl_flag
     ...
     move.l   #log_screen2,$ffff8200.w
     move.l   #phy_screen1,screen
     move.l   #vbl1,$70.w
     rte

; This routine will wait for the vbl to occur
     clr.w    vbl_flag
wait_vbl
     tst.w    vbl_flag
     beq.s    wait_vbl
```

log_screen1 = address of screen 1
phy_screen1 = address of screen 2
log_screen2 = shifted address of screen 1 (for hardware)
phy_screen2 = shifted address of screen 2 (for hardware)

Whether this works on the Falcon I've no idea. But you get the idea. If you really need to get around the 256-byte restriction on the STFM, then you can always sync-scroll, which allows you to start the screen address on an 8-byte boundary. See the Mindbomb main menu for a good example of this. Or some of TCBs screens.

You say you're copying screens to the buffers. What do you mean by this? If you could give a more detailed explanation of what you're trying to do it would be a great help. Is this a game? Demo? There are _many_ techniques for speeding up what you're doing, but often they are restricted to certain things.

I've had hour-long debugging sessions finally ending in finding that
the include file _before_ the offending one had a missing ; or
something. You could check that out.

Regards,

<rant>

Be careful when you start assuming "product X" was written in "Language Y", and therefore Y is a very good/bad language.

This is a completely incorrect inference. The skill of the programmer is paramount here. A good programmer behind a crap language can do just as well - if not better - than a crap programer behind a much better language.

(I have heard such opinions ["X uses Y, so Y is good/crap"] before, and find the tadger-comparison that the language wars devolve into ["L has GOOGOL, but Q doesn't, so Q sux Ls appendage"] tiring to wade through).

</rant>

(Not wishing to attack you or your post in particular, but it did mention an "X written in Y", from which the capability of Y can be inferred by the lazy/ignorant)

This is quite simple.
All you have to do is add 0x8000 to each value, and

the sign extension will cause the negative values to wrap around,
be careful with BASIC though, since it might not do what you expect.
In C and Assembler it works.

What do you mean that it trashes the screen. If you're trying to change the
desktop resolution it won't work that way, since GEM don't know that
the resolution is changed.

What you have listed appears to be valid code - although step 3 seems a
bit suspect. It could also be a bug in NVDI.

Here is what I use (suitably trimmed)

```
     appl_init()
     vhandle = graf_handle(...)
     v_opnvwk( wi, &vhandle, wo )
     evnt_keybd()
     v_clsvwk( vhandle )
     appl_exit()
```

> I managed to disassemble the code using GFA assembler, but I don't
> really understand the format of ST executables

The header of an executable is:

```
struct programheader {
     u_int16_t magic;        /* always 0x601a (bras)   */
     u_int32_t textlen;  /* length of text segment */
     u_int32_t datalen;  /* length of data segment */
     u_int32_t bsslen;       /* length of bss segment  */
     u_int32_t symlen;       /* length of symbol table */
     u_int32_t reserved;
     u_int32_t flags;        /* program load flags     */
     u_int16_t no_reloc_info;     /* if != 0, the code is   */
                         /* position independent   */
}
```

The text segment immediately follows this header. The data segment
immediately follows the text segment. The symbol table immediately
follows the data segment. The relocation info immediately follows
the symbol table.

The text segment may of course contain constant data, but contrary
to the unix a.out format there is no entry point in the header,
hence the text segment must start with an instruction.

```
   25 == 0x19
-2756 == 0xf53c
```

((0x19 << 16) | 0xf53c) => 0x19f53c, looks like a valid address.
Maybe you must declare high and low words as unsigned integers.

Regards,
Waldi

Well, not so much of a teaser as a whole game :)

Has anyone seen Worms (made by Team 17) on the Amiga or PC?
(a cross between tank wars and lemmings - awesome game!)

If you haven't then you should have a look at it and become enlightened :)
If you have... I propose the challenge of writing it for the 1 MB+ STE /
TT / Falcon - with enhancings for each system :) - you may
(actually probably will) have to get permission from Team 17...
you can email them at
dudes@team17.com
whether you get any response from them is another story...
I will post other adresses as I get hold of them

```
        _                Julian Forsythe                _
      o( )          Christchurch, New Zealand          ( )o
     /  /\    Internet Email: clifton@southern.co.nz    /\  \
```

I'll have a look, but I doubt if that is the problem. I only have one header
file that is created manually by me, the other headers are the AES, VDI and
resource
file headers.

That is exactly the same, I just retain the original handle in case I ever
open another workstation (eg, for printing). As for it being a gug in NVDI,
mine seems to be the only program that comes up with it.

Does anybody know how to add a machine code routine into c.
I have a sample playing routine and I need to be able to pass some data to it,
In gfa I malloc() some memory and load the source code into there and then put
the data into the correct locations using offsets from the starting address.
Any ideas on how to do this using sozobonX.
DAN

: the format of ST executables - the disassembled code has a load of jump
: instructions at it's start, now I don't know whether these are real
: instructions, or a data storage area. I haven't done much assembler!
Sorry to be so negative. But w/o knowing much assembler you're probably
just wasting time. Honestly.

The TOS header looks like this:

```
typedef struct
{
   word  magic;         /* 0x601A */
   lword text_len, /* size of text segment */
         data_len,
         bss_len,
         sym_len,
         res1,
         prgflags;
   word  abs_flag;
} tos_header;
```

If you really wanna disassemble this, use these hints.

1) replace all absolute addresses (like Hardware / lower memory)
   with symbols (like MEMCONF etc.) replace all relative
   addresses like $136784 with L_136784

2) identify subroutines that issue TRAPs. Find out what the
   traps do, name those subroutines

3) find strings, name their addresses

4) Now from the start try to analyze whats happening, ignore
   big functions for now. Look for the little shit like memcpy
   , getenv strcmp et.c.

5) Keep the CD player spinning all the time :)

Expect to spend _quite_ some time doing this, if you've never done this
before. The benefit in the end will be that you understand the program
better than the original programmer ever has (no joke).

Certainly, but as there was no mention of this sort of thing, where's the
problem? I am pretty capable of figuring that out for myself, but thanks for
pointing it out.

>
>This is a completely incorrect inference. The skill of the programmer is
>paramount here. A good programmer behind a crap language can do just as

It was the skill of the programmer that I was commenting on. What I like to
do when I'm reading something is to let the words transfer their meaning,
and avoid trying to paste my preconcieved ideas on top of some stand-out
words in the text - is this something that you could usefully employ in the
future?

>well - if not better - than a crap programer behind a much better language.
>
>(I have heard such opinions ["X uses Y, so Y is good/crap"] before, and
>find the tadger-comparison that the language wars devolve into ["L has

>GOOGOL, but Q doesn't, so Q sux Ls appendage"] tiring to wade through).

I appreciate this. I am sorry, perhaps I should have e-mailed Tony directly on this matter. However, yours is the only reply to this (asides from 1 humorous one), and therefor the only one likely to start an arguement.

> ></rant>
>
>(Not wishing to attack you or your post in particular, but it did mention
>an "X written in Y", from which the capability of Y can be inferred by the
>lazy/ignorant)

Ha. Which bracket do you fit into then, Mr Misread?

I stated quite clearly that I knew nothing about Hisoft 2. I made no comparisons between languages. I made a recommendation based on 2 salient points; firstly, I know the language (GFA), and secondly, I know some people are quite expert in that language and could offer the sort of help that Tony was looking for. No more, no less.

Please don't take this post as any more of a personal attack on you than yours was on me. A suggestion though. If you do want to flame the arse off of me, e-mail me direct. I'm sure most of the group don't want to read a private bickering match between me & you.

A puffed-up & self-righteous Steph.

It may support something along the lines of 'asm' for inline code but
the best way to do it is to have the assembler in one file and the C in
another. As you haven't done this before then you can get the compiler
to help you once you have found the correct options ...

E.G.

```
main()
{
 printf("Hello ");
 asm_bit("there ");
 printf("World\n");
}
```

asm_bit() will be in assembler. Write a nearly blank routine in a separate file which has the required arguments ...

```
void
asm_bit(s)
char *s;
{
 s = NULL; /* forces the compiler to access the argument */
}
```

and tell it to generate assembler which will produce (in my case, yours will probably differ) ...

```
cc -S asm_bit.c
```

which produces asm_bit.s containing ...

```
globl    asm_bit_

asm_bit_:
     link a6,$0
     clr.l    8(a6)
     unlk a6
     rts
```

The compiler has generated to basic prototype for you and makes the asm_bit() function accessible to be called like any other C function. A nice and neat solution. All you have to do is insert your assembler. The original asm_bit.c can now be deleted.

```
globl    asm_bit_

asm_bit_:
     link a6,$0    /stack frame for locals (none here)
               /clr.l removed, its done its job of telling
               /us arg 's' is at 8(a6)

               /code to move arguments asm_bit() arg list
               /to correct places in your code below

     movem.l ?,-(sp)    /save appropriate registers

               /insert or jsr to your code here

               /restore saved regs
```

```
     unlk a6   /kill stack frame
     rts       /to main() in this case
```

All you have to do is find the correct switches to make your compiler generate assembler and experiment with trivial examples for a bit to find out how varying arguments are passed. You of course will have to find out about the compiler's register usage.

and compilation should be a simple equivilent case of

```
cc -o example.prg main.c asm_bit.s
```

Provided you have not messed with critical compiler registers your assembly section can easily call other functions ...

```
globl asm_bit_

asm_bit_:
     link a6,$0
     move.l   8(a6),-sp
     jsr  printf_
     addq.w   $4,sp
     unlk a6
     rts
```

I hope some of it makes sense!

>bod out there with the answer?

What I said still goes, v_opnvwk() returns void so that is going to
crop up as soon as the call works. The following has just this moment
been compiled and tested to be *doubly* sure ...

```
#define  DEF_VDI       /* simply a conditional macros which defines
               * my intin,intout arrays etc */
#include <gem.h>   /* your equivilent of aes.h and vdi.h */

main()
{int wki[11]  ={1,1,1,1,1,1,1,1,1,2},
     wko[57],
     nowt,
     vh;
```

```
 /* this could be a cause of invalid opcode */
 /* no appl_init() = no Gem calls */
 appl_init();

 /* obtain physical screen handle */
 vh = graf_handle(&nowt,&nowt,&nowt,&nowt);

 /* convert to virtual screen handle */
 /* NDI has 128 workstations iirc */
 v_opnvwk(wki,&vh,wko);

 /* check for vh failure omitted!! */

 /* prove we've got a valid workstation */
 v_gtext(vh,160,100,"Hello World");

 /* close it */
 v_clsvwk(vh);

 /* allow AES to free system resources */
 appl_exit();

 /* success */
 exit(0);
}
```

If this fails check that your int size is really 16 bit and not 32 bit.

Even my K&R compiler will not allow me to assign results from void functions to anything. Check that the header has been pulled in and that all is defined and that it is defined correctly. It is not unknown for headers to be wrong. v_opnvwk() is void, reguardless of what your header has it defined as.

whoops, I got the error message wrong, it wasn't an error in the handle
(which is what I assumed it said). The error is "invalid opcode, Handle = 8"
which is not the same. But, I'm still none the wiser. Any knowledgeable
bod out there with the answer?

: really good games on the Falcon ARE possible!!!

Thanks! We are doing our very best... btw, the name of the game have been changed to "Willie's Adventures". I just got to mention one thing about bitplane vs. TrueColor mode. You can't really say that any of these modes are quicker than the other. It all depends on what you are planning to do on the screen. It would be impossible to do "Willie's Adventures" in TrueColor for us for an example. The TrueColor mode is great for doing texturemapping and effects like that, but not very good for games like ours. Drawing bigger sprites in TrueColor takes more processing time compared to bitplane mode, and in bitplane mode it's also possible to make use of the different bitplanes to do things like parallax scrolling, something that definitly is impossible in TrueColor mode (of course it's possible but not in full frame rate).

Anyone that are interested in our Falcon030 game but haven't found it. Take a look at <ftp.uni-kl.de> or <ftp.cnam.fr>. It will also be

available on our homepage pretty soon.

Can somebody tell me how to adress the Avalon DA-Board (from Steinberg) in Assembler ? I checked the entire memorymap to see if I can get any kind of response from the cartridge, but it just doesn't react. Or does somebody know an emailadress from Steinberg or something like this ? Any help would be appreciated.

Eddi

>similar experiences.

On any atari machine you can set the screen address at any one time.
The change occurs the next VBL, that is, BEFORE the VBL interrupt
uccurs. This means that you actually set the screen address to the
screen you want to write on at the beginning of the VBL.

Vector $70 contins a pointer to the VBL interrypt. That is, the interrupt
that gets calles every time AFTER the screen address has been read and
set from the screen address pointer.

On the STE and onward (TT, Falcon) the video address counter is no
longer read-only, which means that you can set the screen address
in the middle of the screen, effectively making half the screen
hardware scrolling while keeping another half of the screen static.

Hi folks,

I just started with game programming on the falcon.
I want to write a 3D-game and am using C, eventually
with some assembler.
My biggest problem: I come from the PC and Mac-world and
therefore I have serious problem to figure out how to get
the best out of my Falcon.
One example: I made a little program with two swap-screens
to figure out how fast the falcon is in 15 bit mode.
I noticed that the framerate dropped dramatically when I
moved the mouse during the animation.
I assume that it has something to do with some kind of system
interrupts, but I have no idea.
I'd really appreciate if someone has some basic C-routine, like
"hello world", just for games, which includes all the typical,
needed initializations to get a game going on the falcon.
Any help would be appreciated.

Hi everybody,

does anybody know where I could get the specifications of the sample format
of the sample editors Sound Designer (Digidesign) and Avalon (Steinberg)?
Both programs are rather out of date and ran on the Atari St platform.

Any information would be highly appreciated!

chris

An easy and cheap solution is to use the free MiNTlibs (and gemlibs?)
which work on Pure C as well as gcc and Lattice. The MiNTlibs certainly
support more recent GEMDOS calls..

> So how does Lattice C (which is the only currently supported C,
> right?) compare to Pure C?

Lattice is not being developed any more. It is still supported in a
sense, however Hisoft are not keen to release any more versions.

> (_Is_ there an assembler or would I have to get
> Devpac?)

Yes there is an assembler. It works but isn't as good as (say) Devpac.

Many moons ago, I wanted to do the same thing but couldn't locate any
info. What I ended up doing was creating a sample in Avalon that was 100
samples long - 16bit. Then, in the sample info page I filled in all the
data I could, loop points, comments, etc, making them all different. Then
I did a hex dump of it and worked out what every character meant!! It
took ages, but then I still havent received any replies to my original
enquiries, and that was about 4 years ago.

I don't have this info any more, but hope the suggestion helps!

John.

>code. But even stuff I program myself seems to be rather buggy under

PureC should only produce faster executables for very simple code
(or code with lots of function calls). It's optimizer is almost
non-existent, but it does really good register allocation.

Lattice C has a very good optimizer, but its register allocation often
lets it down. Especially it seems to have problems optimizing when you
use 16 bit ints. I've had code run twice as fast when compiled with
32 bit ints, for no reason other than that the optimizer got confused
by the 16 bit ints.

GCC beats both the others when it comes to optimization, but its
inability to handle register parameters to functions can cause
performance drops sometimes.

I did a comparative test between GCC, Lattice C and TurboC some years back, compiling MGIF with full optimizations on all of them (that was the beginning of my involvment with MGIF, by the way).

While the TurboC code was slightly faster at a few things, it also lost by as much as six (6) times at other code because of the lack of optimization.
I've not seen any real difference between the code produced by PureC and the TurboC version that was used for the test back then.

I could probably dig up that old article if anyone's interested.

>   What I like about Pure C is its development environment (nice
>integrated help and stuff), its compiler speed, its code tightness and
>speed, and the integrated assembler. How does Lattice compare on
>these points? (_Is_ there an assembler or would I have to get

The lack of a source level debugger was always the main problem with Lattice C IMO, but there is supposed to be a third party one available by ftp nowadays. On line documentation can be had via ST-Guide and the environment for the later Lattice versions was much better than the PureC/TurboC ones IMO.
Naturally, compile speed is important as well and there's nothing that comes close to PureC for that.

I myself use GCC at least 99% of the time nowadays.
It looks like it's the only one of the three that's still supported.

 Hi Peeps
  Looking for a sub routine that will take the current date, ie DDMMYYYY and return the actual day ie: Mon, Tues, Wen etc etc
  Something as small as possible that will also take into consideration leap years and will work from any year to any year

Put simply, I need to know the actual day name, of any given date,

Please help if possible, Many thanks :)

BTW, Any Basic Launguage will do as I should be able to convert it<?>

Cheers.....!ynoT

Subject: DSP - matrix setup & LOD files
Date: 1996/02/10
Message-ID: <4fif2a$al2@info-server.surrey.ac.uk>#1/1
X-Deja-AN: 138815084
organization: University of Surrey, Guildford, England
newsgroups: comp.sys.atari.programmer

Hi,

I'm trying to write a program which uses the DSP - however I'm having problems setting the matrix & loadinig DSP files. What I need to know is:

1. How can I configure the matrix to do the folowing;

   a. ADC -> DSP -> DAC (i.e. Add a DSP effect to sound going from the mic input to the headphone output)
   b. DMAplay -> DSP -> DACa (i.e. Add a DSP effect to a sample file being played back)
   c. ADC -> DSP -> DMArecord (i.e. Add a DSP effect whilst recording a sound file)

   (I know I'm supposed to use the Devconnect() command, but every combination I try doesn't seem to work.)

2. How do I load .LOD files? I have the 'Modern Atari System Software' (?) book that lists all the commands but it just confuses me - which functions should be used, and how do I know how much memory should be allocated for the .LOD file. (The .LOD file's I'll be using are those that come with WinRec - I might right my own later, but I want to test

the DSP set up now.) The book gives some wierd formula for working this out - but as I don;t know much about the X,Y, and P registers of the DSP it doen't make any sense to me.

Thanks for any assistance.

Please email any replies to: ee11aw@surrey.ac.uk
(This is because I can only check the newsgroups about every month or so)

>He was looking for the opposite, converting a long integer to a string.
Ah, I should pay more attention to the thread. ;-)

>ISO/ANSI/POSIX do not fully offer that functionality. Sprintf() only
>handles octal, decimal and hexadecimal representation.
Yes, there's Lattice stci_d family which only do dec, oct and hex.
I wrote one for binary. Low base numbering systems aren't that difficult.

Subject: Speedo Fonts in G_PROGDEF
Date: 1996/02/11
Message-ID: <4fkanu$9i6@inca01.inca.co.nz>#1/1
X-Deja-AN: 138895545
organization: INCA
newsgroups: comp.sys.atari.programmer

I have just been playing with G_PROGDEF objects in my dialog boxes.

having written check-boxes and radio-buttons that mimic the behaviour on
Widows and Mac, using G_PROGDEFs,

All this was done using Speedo 4.1 under GEM AES 4.1, with MiNT 1.12, with
memory protection 'on'. I run a 20 Mbyte TT with TOS 3.05, and usually
have between 8 and 12 Mbytes of RAM left when running the generated code.

I thought it would be straighforward to implement a font sample inside a
dialog box using G_PROGDEF, and drawing the text within it using v_ftext.

But, to my horror, I find that it seems to bring the system to a "you
must reboot" stage any time I use any Speedo calls within the G_PROGDEF
code. Standard VDI calls work OK.

My general algorithm in Lattice C 5.60 is as follows:
(I've snipped out obvious clipping/positioning code)

There are no AES calls within the PROGDEF code.

```
int __stdargs __saveds progdef_callback( PARMBLK *pbptr )
{
  sint16 fnum;
  sint16 fsm;
  schar8 name[32+1];
  sint16 d;

  fnum = vqt_f_name( vhandle, font_in_list, name, &fsm );
  vst_font( vhandle, fnum );
  vst_arbpt32( vhandle, 0x98000, &d, &d, &d, &d );  // 9.5 point text

  //positioning... set x, y
```

```
  v_ftext( vhandle, x, y, name );

  return 0;
}
```

So, is it a bug in Speedo, GEM, or my code?

having just got interested in actually programming on the atari I've tried to write a small program, the problem is that using v_justified misses the first two characters of the string. Most of the program was copied from COMPUTE! VDI book.
Any help would be greatly apprieciated.

The following program prints

```
   TEST ITEM G1
   S T   I T E M  V 1

   TEST ITEM G2
   S T   I T E M  V 2
```

etc
I've programmed in 'C' for a while, but this is my first attempt at GEM/VDI , I'm using a 1040STFM TOS 1.4 4MB with Lattice C 5.5. It even gives me the problem when run with no AUTO or ACC's.

Andy.

I found with a simple program to find primes up to 60000 that Lattice C
(31 secs) beat GCC (49 secs) hands down, (Both optimised with 16 bit ints).
While the same code run under MagicMac on my 25Mhz 680LC40 LC475 using
Lattice C and Mac using Think C took an identical amount of time (3 secs),
but under Spectre on the 8Mhz 68000 ST the Think code was the slowest (58
secs) (this is just the calculation with no screen work).

I use X-Debug on the ST for source code debugging the lack of structure
support is a pain but it better than assembler level debugging.

Of course GCC is more than just a C compiler as it does C++ as well which
is nice. I redirect the stderr error messages to a file to make it easy to
find source code problems.

newsgroups: comp.sys.atari.programmer

Some people asked me to post details about the vqt_get_table() function. First I want to make clear that I dont have any official docs for this nice function. I found its usage by disassembling SpeedoGDOS. It worked on my machine, it will probably work on your machine but if it doesn't please dont blame me :-)

First add the following text to your "vdi.h"

```
/* begin */

typedef struct speedomaps {
     struct speedomaps *next;
     unsigned int id;
     int *table;
     int dummy;
}SPEEDOMAPS;

void vqt_get_table(int handle, SPEEDOMAPS **map);

/* end */
```

map will be filled with a pointer to a SPEEDOMAPS structure

As you can see the SPEEDOMAPS structure contains:

a pointer to the next SPEEDOMAPS structure if one exists,

an integer value which distinguishes the various mappings, possible values are:
For Speedo fonts : 0x3030, 0x3031, 0x3032, 0x3131, 0x3132, 0x3133, 0x3134
For Postscript Type 1 : 0x5431
For TrueType : 0x5454

a pointer to an array of 224 integers which is used as a lookup table for ASCII 32 to ASCII 255 and

an integer which I dont know its purpose, if it has any.

So if somebody wants to change the mappings, calls vqt_get_table() to get the pointer, then walks through the list until he matches the id he is searching (you shouldn't expect that all of the above id's exist under all versions of SpeedoGDOS). Now you either change the pointer to your table or you change the internal table values. I dont know which method is legal but which ever you take keep in mind that there is no function to restore the default values. It's up to you to take a

copy of the default data.

Another method to change the mappings is by creating a file called SPDCHAR.MAP . Its structure is very simple. For each mapping you want to change you put its id followed by 224 words. Simple. Note that you dont have create tables for all possible ids and also there isn't any order you have to follow if SPDCHAR.MAP contains mappings for more than 1 id. The new mappings are set during the boot.

I had a very good motive to find out how to change the mappings. I'm Greek and when SpeedoGDOS 5 was released I hoped that at last I could use some decent Greek TrueType fonts. Imagine how I felt when I realised that most Greek characters where vanished! I hope other "minorities" of the Atari world will find this text helpfull. The bad news are that NVDI 3.01 (dont know for newer versions) does not support the vqt_get_table(). Its a shame because it spoils an otherwise perfect piece of code

I wrote a patch which changes the way NVDI builds the lookup tables in NVDI.FIF but its not the same :-(

Thats all folks

Panayiotis

Any data packet from the keyboard processor (joystick data also arrives that way) causes an MFP interupt. Dunno the number from memory. But you

don't need to change this vector, as the kernel interupt processes the
data via a list of vectors, each specifically for a particular event,
like key presses, mouse data, or joystick data, so you just have to
replace the joystick vector. The address of that list is returned by
Kbdvbase(), an xbios call.
After you installed your routine you must also tell the keyboard
processor to look for joystick movements and to report them.

Cheers Peter

I nearly just answered without compiling it first - good job really.

I was going to say that v_justfied() needs GDOS and leave it at that
but it worked fine on my 520STFM TOS 1.4 4Mb with and without NVDI and
with and without MagiC using Mark Williams C 3.0.9.

This begs the question - is Lattice at fault? Over to somebody else!

Current hardware revision B.
BootROM B001, JagOS version 1.07

A | in front of a line means that some new stuff
has been typed in there since the last info file...
----------------------------------------------------
```

The Jaguar Server project started out in August '94. The goal was to make a cheap developer kit for anyone that wanted to program for the Jaguar. Atari's own developer kit was $5500 and that was WAY to much if you just wanted to hack and program the Jaguar just for the fun of it.

The very first prototype was built around the Mega ST's 'MegaBus' All of it was hand wired together using a total of 21 IC's.
I can tell you that this board had VERY little empty space on it..
This prototype was soon scraped, as i begun work on the Rev A board, using a different approach this time. It was built for the cartridge port and could then be used on all Atari computers not just the ones having a 'MegaBus'.
To keep the cost down, i also decided to use the Jaguar's 2MB main memory and not include any expensive RAM chips in the Jaguar Server hardware.

The Rev A board was up and running with very simple software in Februari '95. As the Rev A board had some small flaws, i made some changes to the layout and came up with the Rev B board.

More serious work now begun on the Software - The Shell running on the Atari computer and the JagOS - Running on the Jaguar.

General Info.
---

* Use the Jaguar Server kit to develop Jaguar programs !

* The Jaguar Server runs on all Atari ST/STE/Falcon/TT computers.

* The hardware plugs into your computers cartridge port. From the cartridge hardware goes a 40 pin ribbon cable into the Jaguar.

* Uses a slightly modified standard Jaguar. You send our Jaguar to me for modification, and i'll send it back to you.

* You can change betweeen 'modified' and 'orginal' Jaguar by the flick of a switch. A reset button is also installed. ABSOLUTELY _NO_ compability problems with Jaguar games.

* No programing restrictions apart from a 2Mb main memory limit in the Jaguar. Future software updates will be able to upload data at the command of a running Jaguar program.

* You use the Jaguar Server software to upload programs/data to the Jaguar. The software looks best in resolutions over 640*400.

* Software updates to JagOS (Jaguar Operating System) are possible without burning a new EPROM chip simply by using newer software.

| * Upload transfer rate is currently 83 Kbyte per second on a 8 Mhz
| Atari and 131 Kbyte per second running at 16 Mhz.

  * Use the Devpac 3 assembler or any other code generator to write
    programs.

  * A remote debugger is under development.

  * Software updates and info are availible on InterNet World Wide Web
    at http://www-und.ida.liu.se/~t94patsa/jserver.html
    and by filerequest with any FidoNet compatible mailer to
    STacken BBS on FidoNet 2:204/219 under the magic name JSERVER

  * A Jaguar Server Developer Mailing list are availible for
    programming discussions. NOT open for anyone.
    E-mail to nat@zumdick.rhein-main.de for more info

  * The Jaguar Server development kit contains this...

          + Jaguar Server cartridge (hardware)
          + Jaguar Server Shell & JagOS (software)
          + Switches, ribbon cable, connectors and everything else
            that you need to start programming right away.
          + A few Jaguar (*.JAG) programs and example source code.

  * IT DOES _NOT_ CONTAIN THE FOLLOWING... You have to get these
    things yourself....

          - No 68000 or Atari RISC assemblers.
          - No Jaguar technical documentation.

  * 'Hacker' experience and good knowledge of assembler programming
    is STRONGLY recommended because of lacking Jaguar technical
    documentation.

  * The Jaguar Server is NOT connected to Atari Corp. in ANY way.

  * _Introduction_ price is :

            3400 Skr
| 730 DM
| 330 GBP
| 510 USD for the Jaguar Server and a new Jaguar console
                    (Swedish PAL without game!), modified and ready
                     to be used directly.

             1500 Skr
| 325 DM
| 145 GBP
| 225 USD for the Jaguar Server and modification.
                     You send your Jaguar to us...

Shipping is NOT included in these prices and will be added!

Around 200 Skr for shipping is normal.

Some technical info.

A Jaguar (*.JAG) program is built around a header. There are currently five different headers, each with it's own use and advantages depending on the development environment and programs.
For example, one of the headers looks like this (for Devpac 3)

```
*-----------------------------------------------------------------*
* Standard JagOS 3 Upload & Run parameters.                       *
* ? Roine 950420                                                  *
*-----------------------------------------------------------------*
  OUTPUT i:\*.JAG          * Output standard Atari Executable.

down    EQU $5000          * Download adress in Jaguar.
start   EQU $5000          * Program start adress in Jaguar.
        OPT D-           * No debugging info.

        dc.b 'JAGR'        * Magic to skip Devpac Header.
        dc.w 3             * JagOS 3 - Recive & Run.
        dc.l down          * Download adress.
        dc.l c_end-c_start * Lenght of Jaguar Code.
                           * A dc.l 0 are also possible.
        dc.l start         * Start adress.
        ORG  start         * If position dependent code.

*-------------------------------------------------------------
c_start                    * Jaguar code start.....
        NOP
        NOP
        ILLEGAL            * Not much of a program...  Hmm...
c_end                      * Jaguar code end.
*-------------------------------------------------------------
        END
```

Jaguar Modification

As there has been some trouble with users installing things wrong when modifying their Jaguars to accept the Jaguar Server Development kit, I have decided to NOT to let users do this modification on their own any more.

I really think that this solution is the best for both parts.
This means that the Jaguar Server Development kit will work when you get it, just plug it in the computer and start programming and i will get happy customers with working kits!

This means that you now _MUST_ send us your Jaguar console and i will do this modification for you. This will ensure that the modification

is correctly done and working 100%
It is also possible to order a complete new Jaguar Console (PAL) if
you for some reason cant send your Jaguar to us.

Misc Info.

  If you have more specific questions or write me by E-Mail...

Does anyone know if there is a compiler library for GFA Basic 3.5
which allows a programme to take advantage of an FPU if fitted?

Thanks in advance for any info.

Maybe you've got an older version of Pure C that doesn't provide bindings
for those calls, as they at least the second one is a fairly recent one ?

Cheers Peter

I am trying to install the Sys Gem 2 library on my Pure C system.
However, the Pure Linker gives me the "undefined symbol" message
whenever I try to build a program.

I have installed the LIB file and the H file in the correct
directories, and the PRJ file contains all the LIBs delivered
with Pure C plus SYS_GEM2.LIB.

I get 8-10 undefined symbols, and I remember two of them to be:

"vdi"
"appl_search"

I have of course tried to build the demo program, and the same
things happen. I am sure I have just forgotten something really
stupid, but please help!

Hi folks,

I'm looking for tools (_anywhere_ on the Internet) which will allow me to create ST Guide On-Line Help documentation files from some (yet undecided) input format, preferably Texinfo or RTF (Rich Text format).

Any idea where to get this kind of goods and what I should look for exactly? If you now source-level distributions (preferably UNIX compilable!) I'd be jumping for joy :-) as I'd like to cross-compile these ST Guide On-Line help dox when possible on SGI or Sun UNIX.

It's absolutely fine though if you've got a pointerto an ST based tool as I'll have my friends do the job for me then ;-)

I'll check this newsgroup but if you can: please CC your answer to my email address below:

Ger(rit) E.G. "Insh_Allah" Hobbelt
Email: i_a@mbh.org

Thanks!

This is only true for the 'Standard Joystick Ports' and IIRC he was
asking about the extended joystick ports of the STE.

The extended joystick ports are directly memory mapped (hurray!) and
don't go through the keyboard processor, which unfortunately means that
they do not trigger an interrupt (boo!).

So you'll need a TSR that patches onto a timer interrupt and polls the
hardware addresses of the extended joystick ports. I should use the
Vblank interrupt for the timer, as joysticks don't need much polling.

Try setting the compiler switch for `generate underbars'. It could be
that you have it set off, and the libs were built with it on. So the
linker tries to find `vdi' which is called `_vdi' in the libs.

Good luck,

Subject: converting ATARI ST software to IBM 486DX33
Date: 1996/02/12
Message-ID: <4foefk$r44@pathway1.pathcom.com>#1/1
X-Deja-AN: 139129061
organization: Pathway Communications
newsgroups: comp.sys.atari.programmer

Hello!

I am the owner of both an Atari ST and an IBM-compatible, a 486DX33.

My question is this. Now that I'm using the IBM for a lot of my work at business, I'm kind of missing a lot of the games that I used to play. The Atari is getting kind of glitchy I've noticed, and I'm really annoyed that many games that I paid good money for are going to go to waste.

Is there any way to run this software (short of re-buying the IBM versions) on an IBM that anyone knows of? I am feeling kind of doubtful that I could actually run anything right off of the diskettes, but I would easily

be willing to settle for an emulator which I could use to translate Atari ST software over a modem connection or direct port connection.

Any ideas or suggestions? If so, please e-mail me directly at my address below.

Thanks,

Derek.

: I noticed that the framerate dropped dramatically when I
: moved the mouse during the animation.

Just a hard fact : there isn't anything you can do to speed up things
apart from using assembler. Falcon is simply terribly slow machine
especially in high color mode....And for all the Atari advocates, I have
coded on both Atari and Amiga machines so I know... Falcon has a
16-bit bus to the memory so the direct movem.l d0-d7/a0-a7 thingy is only
able to pull about 64 kb/vbl which is simply bad performance. With some
trics you can get something like 100 kb/vbl but even that ain't enough.
My advice to you is that if want to code games (with fast graphics) you
better use only the 256 color mode. Or start coding games on diffrent
machines. If compare Falcons speed to the other machines it easy to
notice slow it actually is.
For example :

Amiga 1200 7 mb/sec (12 mb/sec)
486 PC with vlb/pci bus 22-50 mb/sec (depends on card)
Pentium PC with pci bus and fast card 50-80 mb/sec
All Powerpc machines with pci bus 30-80 mb/sec (depends on card)
Falcon 030 3.2-5 mb/sec

All figures are for the writes to video memory. In amiga's case the
second figure is for the fast memory(fast mem can only be used for the
normal data, not for the graphics). On Falcon all the operations are in
3.2-5 mb/sec range.

Your code needs to be __saveds and depending which interrupt you may want to
make it __asm so you can get the values passed to you. Apart from that, just
write the address of your routine into the vector. To go tsr, you quit with
Ptermres().

>When linking into the interrupts, is it possible to make the program both
>screen resolution and machine independant, ie. it will run on both an ST and
>a TT withoout to much effort in coding seperate sections for either machine.

That depends what interrupt. It shouldn't be a problem with msot things.
Obviously if you need to do some graphics it's not really possible as I
don't think GEM is re-entrant.

Well of course you do. C++ files are almost always .cc, .cpp files are
ones that although not C or C++ need to be run through the C preprocessor.

> now managed to get it working but it is SLOOOOWWW. On my falcon with 4

It is rather a memory hog, you might find an earlier version better.
Compiling STonX on my linux PC took half an hour on one file because
it needed 40 megs!

Loading a resource file yourself is pretty easy, but I wouldn't have though
rsrc_gaddr would work in that case (unless it has some undocumented option)

I believe Cfront, the original C++ implementation, used .C, but for obvious reasons this can't be used in a DOS environment (and may cause confusion even under a real operating system) Later unix compilers used .cc but for some reason both MS and Borland chose .cpp for their PC versions.

It isn't. The BIOS is re-rentrant 3 times (?). I have used the LineA in non complex interrupts but I don't know if it is documented to be so.

 would have been suprised if you hadent? ;)

>Tony, what about that _ugly_ mouse pointer? You can't miss that!

 Ho dear, your one of THEM! are you,???? your one of those
 people who had a look at STOS years ago,looked at the sad stuff
 every man and his dog was knocking out at the time, and
 have stuck with that view ever since?

 Well my language disk has a true GEM mouse set and GEM
 fonts installed, these are part of the interpreter, ie the
 default mouse and font sets, YOU are well behind the times
 mate, I have over 50 titles released, you try finding the
 old STOS mouse pointer on any released over the last three
 years?

 Unfortunatly you are not alone, many people are still
 basing there opinions on the STOS of old and not the 1996
 updated version, I would advise yourself and anyone else to
 read ATARI WORLD issue 12, you will then learn just how
 updated STOS is,?

  <smile>
              Cheers......!ynoT

MiNT supports alternative filesystems; there is indeed a MinixFS which
supports long filenames. IIRC, the latest MagiC (v4) supports
loadable filesystems too (?)

Good luck,

This may be a red herring but ...

I have had this NVDI message crop up on occasion. Nearly all the time,
it can be duplicated, indicating a bug. However, on a very few
occasions, it can occur in normally well behaved software (no I can't
think of any examples - sorry!). I have a gut feeling that the cause
is some other software (maybe not releasing handles - dunno).

:
: Strange. I've not had that problem myself, and I use NVDI all the time. I
: did try to ensure things worked OK (and did have quite a large number of
: testers with various setups from a 1Meg STE through falcons & TT's, right
: up to a PowerMac with MagicMac), and no-one had reported it. Oh
: well....perhaps you should have mailled me a bug report?
:
Ok. Well, I didn't look for interference with other installations on my
maschine. I just stared at that NVDI alert ('cos I didn't get it for a
long time, and ran it again on the plain computer. I'll start all over
again, in a more proper way.

: > The plain computer of course does run it, but CLA involves lots of
: > graphics, and this is painfully on a 12 MHz maschine without NVDI.

:
: When used with NVDI or Enhancer, CLA3 speeds up a lot as it makes use of
: off-screen bitmaps to speed up the display.
:
That's what I guessed, but it apparently does not run with NVDI 3.02.

: > > I've got a new release of DUftp (mint-net again) almost ready.
: > >
: > I liked very much the idea of DUftp. I must point out that I really like
: > the way Xwindow window manager display the GUI. And I also like the
: > appearance of GEM. But mixing it up (like having a program with Motif
: > look running in a GEM environment) is to me as ugly as almost nothing
: > else. Please, Craig, go a little bit more for the style guidelines.
:
: ?????I'm sorry, but I don't follow you here. The only thing about DUftp
: that isn't quite standard is that the scroll bars are on the left for the
: remote & local file lists. Everything else is modern standard GEM. A menu
: bar, a couple of non-modal dialogs, one or two editable text fields, a pop-up
: menu or two....nothing non-standard about that. The drag & drop handling is
: standard as well...it's certainly nothing like Motif.
:
I remember other things like very strangely shaped scrollbars and so on.
It's been a while since I looked at it, maybe I confuse something. If so,
you'll read my apology.

Cheers Peter

Hello,

a friend of mine got 2 hard diks from PC. These disks are SCSI disk, Prodrive
LPS 120 and 340 from Quantum.He's working with Hushi scsi tool and can read
sectors, verifie these but can't partitionnig nor installing a bootsector. It
seems that these disks are low-level formatted, and that he can't do nothing.

Does anybody know a solution for this problem?

Regards.

Did they work when they were last used on the PC - and if so - what O/S
were they used under?

I'v had no problem moving drives from PCs onto Ataris and back again.
Whichever the drive is connected to - I can happily format and partition
it.

This is using ICD Pro Utilities on a TT. Its a couple of years old now -
but has useful features like being able to change the interleave. I had
a drive on my PC with an interleave of 7 - and couldn't find anyway of
changing it (actually only when I connected it to the TT did I find out
that it was the interleave which was making it so slow). Anyway I had no
problems formating and paritioning it using the ICD Pro Utilities - and
after a DOS FDISK - the drive is now happily back up and running on the
PC.

:-)

Roland.

Some drives need arbitration, meaning the computer has to identify itself with
its own SCSI-Id when requesting data. Since the TT is the only Atari-computer
with a proper SCSI-interface, this problem should only occur on ST-computers (I
don't know about falcon) when using disks via ACSI-port, because ACSI works
without arbtitration. But it seems strange to me that you can read sectors. On
which Computer does your friend run his drives ?

I am trying to create a simple cooperative multitasking system in Forth
on the Ste. This is for a game. I am running into a problem whenever my
multitasker trys to define a paramater stack (sp...a7) for an
individual task. I am assuming that there are some pointers in the first
1k of memory, in the St, which determine the upper and lower limits for a

data stack using a7. I have not been able to determine the proper way to
change this address register without generating a bus or address error. I
do not have any docs. Help.

No, there aren't. The stack can go as far as the memory reaches.

> change this address register without generating a bus or address error. I
> do not have any docs. Help.
>
Well, if you got an address error, the reason is obvious : You stored an
odd address into A7. Bus errors are generated on a few occasions. These
are :
- You accessed memory that's not there.
- You accessed the lowest 2 K in memory while in user mode.
- You accessed the I/O area ($fxxxxx) while in user mode.
The words "You accessed ..." may very well mean that you've set A7 to
one of the mentioned addresses and led the program do some stack work.

Note also that the OS does stack access as well. So try to make the
stack larger (try at least 4 K). Maybe you even have to save and restore
A7 for each OS access.

Good luck Peter

Anybody have any tips for this one. I've successfully captured the
horizontal interrupt for the purpose of changing colours from scan line
to scan line, but now I need to use the vertical interrupt to 'reset' my
routine at the top/bottom of each screen redraw.

Unlike the horizontal interrupt, there doesn't seem to be an interface
for capturing the vertical int.

I am working on a bog standard STFM.

Any comments/help is appreciated.

There's the deferred vertical blanking handler:

```
$452 vblsem        short
$454 nvbls         short
$456 vblqueue  long
```

If this is of any use and you know C then email me - I have some code
to make use it.

Talking to myself again.

My mutitasker is now fully operational and enhanced.

Included is a nifty word called ?start

flag ?start task-name word-to-execute

if flag is true, then ?start sets the task to execute that word
if flag is false, does nothing.

Must now see if my implementation of local variables works with all of this
other stuff. I don't see why not.

"Stack Format Error"

The Motorola 68010 processor changed the stack frames created by TRAP and some other instructions. This "new" stack frame format carried on through the '020, '030, '040 and, I surmise, the '060.

A 16-bit "Stack Frame Format Word" is placed on the stack following the SR and PC registers. So, instead of a 6-byte TRAP frame, it is now eight bytes.

The new stack frame will only affect software which is either unaware of this change and alters the stack frame, or software which calls TRAP

routines from the 68k Supervisor mode.

The CPU will "spit the dummy" if, when executing an RTE instruction (or one of a few other instructions which I can't seem to recall at the moment) to return from Supervisor (System) mode to User mode if this value is incorrect. It does so by executing exception number fourteen, which, in the case of Atari TOS, has been set to print a stream of bombs on the screen, the number of which tells you which exception was raised. Atari TOS also defaults to killing the process which raised the exception.

Hello,

Does anyone know how I can turn off the screen & the HD on my stacy by software?
If you know how to do it, please send me assembler, pascal or modula-2 source or some hints!

Maccel has this feature, but I need to have finer control to this.
Are there some new TOS calls in stacy TOS? And how can I check for the availability of these?

thanx,

Simi

I'm amazed that you've grabbed the hbl and not found a way of grabbing the vbl, or do you not have any docs at all? Even so, a little bit of hacking will soon sort that out. Anyway, here's a little snippet of code. Email me if you want some code examples - I'll send some hbl (done via the mfp), vbl, with screen-buffering and music source. Whatever else I've got lying around.

The vertical blank interrupt vector is located at $70. Just save this one and bung in the address of your new routine and there you go. Here's some code that rasters the screen in bars of colour. (The bars are made up from black->white->black.) The second vbl routine will make them move upwards. Wow! This isn't a very good way of doing things really. Much better to use the MFP if you want to change lots of the palette, and keep it that way for a number of scanlines. Eg: a score panel at the bottom of the screen could have a different palette to the rest of the screen. But the MFP isn't that good at changing lots of scanlines (Say you want fifteen differently done scanlines one after another) and basically falls back to becoming like the hbl. In actual fact, the hbl is controlled via the MFP, but the $120 vector gives a nice easy way of doing something every scanline. The MFP wins overall though because it

uses less processor time overall compared to going through the $120 vector, although it may require a slightly different mode of attack. Email me if you want some MFP sources, or get out your disassembler and start hacking any demo, nicely done menu, etc.

Sorry about the crap spacing, but it's this editor's tabs.

I've found the excellent-but-massive gnu-st.txt file (I have probably
got the name wrong). It explained several environment variables that
need to be setup (GNUINC GNULIB GXXINC TEMP, etc) for the gnu 2.x
compiler which I am trying to install. I wrote a small trial c++
program (called trial.cpp) that included the <iostream.h> file but
it wouldn't compile.

On running the compiler with the -v switch (verbose) I found that it
was not looking where the GXXINC variable indicated. Can anyone
throw any light on this problem?

I have a little program:

```
10 DIM A$(50)
20 OPEN #1,7,0,"R1:"
30 PRINT #1,"AT"
40 CLOSE #1
50 OPEN #1,6,0,"R1:"
60 INPUT #1,A$
70 PRINT A$
80 CLOSE #1
```

It breaks with:

```
ERROR-      135 AT LINE 30
```

When I change the 7 in 30 to 13 then instead it says..

```
ERROR-      154 AT Line 60
```

I cannot even find 154 in the error code listings. Can someone please explain to me how to send and recieve to a modem connected to the 850 interface?

I used to program on an 800 but it broke, then I bought an cheap used 800xl and an 850 interface but the previous owner forgot to include the 850 docs.

I am looking for books to teach me how to programm ATARI ST/Falcon games.
My main interest is in graphics and sound and the books should cover
68k, C and M56001 programming.

Oops, made a mistake in my last piece of code - should have been $68.w
not $120.w I only realised last night. Sorry about that. But I was doing
it from memory and haven't coded for a while. Might as well give a brief
info on the MFP since it's better than $68.w.

Ok, the MFP is the Multi-Function Peripheral chip and controls the timers
and serial port and some other stuff. The timer vectors are all located
around $100-$150. The hbl ($68.w) is in fact an extension of the MFP, but
runs every scanline, rather than being programmable as the MFP is. So,

how do we take control of this? Simple, let's jump to your interrupt install code:

```
     ...                ;    your start code here
     move.w   #$2700,sr     ;    stop interrupts
     bsr  save_ints     ;    save all the interrupts
     move.l   #vbl,$70.w         ;    new vertical blank
     move.l   #timerb,$120.w          ;    new timer b routine
     move.w   #$2300,sr     ;    start interrupts
loop
     cmp.b    #$39,$fffffc02.w   ;    space?
     beq.s    loop
     move.w   $2700,sr      ;    stop interrupts
     bsr  restore_ints      ;    restore all the interrupts
     move.w   #$2300,sr     ;    start interrupts
     ...                ;    your exit code here
```

Ok, let's take a closer look here. You turn off the interrupts first since you don't want them still going whilst you're installing new interrupts as the results can be unpredictacble. You save the interrupts (this means the vbl, hbl, and the MFP interrupts you use in your routine - we're getting to that bit). So here's the vbl rout:

```
vbl
     move.w   #1,vbl_flag        ;    flag it's happened
     clr.b    tbcr
     move.l   #timerb,$120.w          ;    new timer b
     move.b   #1,tbdr            ;    start in 1 scanline
     move.b   #8,tbcr            ;    event countdown mode
     rte
```

Ok, this first stops timer b, installs the new routine, then sets the timer b data register to 1, then starts timer b using 8 as the control number - this is event countdown mode. In this mode, each scanline the data register gets decremented by 1, and then the new routine is run when it gets to zero. Here's the hbl rout:

```
timerb
     clr.b    $fffffa1b.w        ;    stop timer b
     move.b   #100,$fffffa21.w   ;    100 scanlines (tb data reg)
     move.l   #tb2,$120.w        ;    new tb rout
     move.b   #8,$fffffa1b.w          ;    event countdown mode
     addq.w   #4,$ffff8240.w          ;    a simple colour change
     blcr #0,$fffffa0f.w         ;    acknowledge interrupt
     rte
```

Ok, take a look at the above. Hopefully you'll understand most of it. The idea is simple - stop the timer, set it's data register, put the address of the next routine to use, start the timer. BUT, you need to also acknowledge that you've finished with the interupt as well, otherwise the channel is left open and is unusable. Ok, here's some more code.

```
tb2
     clr.b    $fffffa1b.w        ;    as above
     move.b   #4,$fffffa21.w          ;    4 scanlines
     move.l   #tb3,$120.w        ;    new rout
     move.b   #8,$fffffa1b.w          ;    start timer
     clr.w    $ffff8240.w        ;    black background
```

```
     bclr #0,$fffffa0f.w          ;    acknowledge
     rte
tb3
     clr.b    $fffffa1b.w
     move.b   #4,$fffffa21.w
     cmp.w    #$0007,$ffff8240.w ;    best blue?
     beq.s    tb3_dn              ;    yes, so we want to go down
     move.l   #tb3,$120.w         ;    this rout again
     move.b   #8,$fffffa1b.w
     addq.w   #1,$ffff8240.w          ;    brighter blue
     bclr #0,$fffffa0f.w
     rte
tb3_dn
     move.l   #tb4,$120.w         ;    down rout
     move.b   #8,$fffffa1b.w
     subq.w   #1,$ffff8240.w          ;    start going down
     bclr #0,$fffffa0f.w
     rte
tb4
     clr.b    $fffffa1b.w         ;    same as tb3, except
     move.b   #4,$fffffa21.w          ;    we're going down the
     cmp.w    #0,$ffff8240.w          ;    blues
     beq.s    tb4_up
     move.l   #tb4,$120.w
     move.b   #8,$fffffa1b.w
     subq.w   #1,$ffff8240.w
     bclr #0,$fffffa0f.w
     rte
tb4_up
     move.l   #tb3,$120.w
     move.b   #8,$fffffa1b.w
     addq.w   #1,$ffff8240.w
     bclr #0,$fffffa0f.w
     rte
```

Can you see what the result will be? Examine the code, and run through a few cycles of it. Draw diagrams if they help, I find them invaluable. Ok, let's go through it - we start with a black background (at tb2), then run tb3 after 4 scanlines. tb3 stops the interrupt as normal, then checks to see whether the blue has a value of 7 (highest my STFM can cope with!) If it is 7 then it jumps to tb3_dn. We'll deal with that in a moment. Otherwise, it adds 1 to $ffff8240. This actually increases the blue amount in the colour. (for colours, use $RGB, where R=red, G=green, B= blue, eg: $0333 = a grey, $0777=white, etc.) Then it acknowledges and runs the next timer b, which is in fact itself. So now we get a brighter blue, and etc... so we end up with a fade of black to blue. Now we get to tb3_dn, which decreases the amount of blue and runs tb4. Guess what that does eh? This is a pretty poor example of the MFP, but you get the idea. This could have been coded differently, in one timer b, using self-modifying code, where the addq is changed to a subq or vice versa. Ho hum. You may notice that the colours flicker slightly at the very edges of the line, this is because the exact moment the instructions are getting run is not the same every time. It is possible to avoid problems

like this, and do special triclks (like opening the borders), but I
leave that for you to find out (or hack!).

Help.

I am using the Mydial extensions for resources, as supplied with Interface, in OASIS 2. Unfortunately, the person who compiled the C code for use with GFA basic left out eh access to the 3-D dialogs functions.

What I need is someone with Pure C or Turbo C who can recompile the source for me. I know what needs changing, and have amended the source, but as my C experience is limited it may be wrong.

Any one who can help please contact me via e-mail.

Thanks in advance.

You can implicity declare where the includes are by option
-I/dev/g/path/to/g++-include
or simpy -I$(GXXINC). You propably have also to add -L(GXXLIB) for
properly linking.

regards,

Simon.

A long time ago I had a copy of G++ 1.40 which worked in 2.5Mb. You need
to run a seriously striped down system - and turn optimisation off. Even
then you will be limited to the size of programs you can compile.

:-)

Roland.

  Hello, I am wondering if there are any Mark Williams C users who can help
  me with a problem I have. The manual doesn't explain how to use the
  LineA routines very well and contradicts itself with the header file.
  In the lexicon (MWC 3.0.5) it says that the instruction to place a sprite
  on the screen uses two pointers but the header file shows four parameters;
  two long (for the x,y position) and two pointers which I assume the first
  is a pointer to the structure la_sprite and the second is enough free
  space to hold the screen's background.

  Another question I have is if I am able to combine VDI commands with
  the linea commands. When I open a virtual screen with opnvwk() and then

use the linea0() (initialize) command I get a crash. I think I read
somewhere that if a program uses line A routines then it cannot use the
VDI nor the AES and must run as a TOS program with the .tos extension.

Thanks in advance for any help.

How should I do to properly install an interrupt that outputs midi from a
timestamped que? It should output the first element, check the time of
the next, and "sleep" until that time.

I want my C application to calculate the times and (if nescessary)
rearrange the que. This is no problem.

The problem is that whenever I try to install an interrupt, my system
hangs or bombs out :(

Any example on installing interrupts in mixed C/assembly is most welcome!

I use Lattice C 5.06

There is quite a bit of contradiction throughout the whole of the LineA documentation. To be fair, MWC did attempt to document what was (and still is to a large extent) undocumented atari routines. On a more helpful note:

```
linead()
int16              hot_spot_x, hot_spot_y;
struct la_sprite   *p;
void          *save_blk;
```

save_blk should be:

```
high rez  74 bytes
med rez       138
low rez       266
```

This needs to be calculated as 64 bytes per bit plane + 10 bytes just in case the program is to run under unknown resolutions.

It's a long time since I did any of this so you will need to get out the debugger and check the size of the parameters passed to linead(). At the machine level, the first two are ints but they *might* be int32 at the linead() function level. (Off the top of my head) You should see something like this:

```
linead_  link a6,$something
     move.w   0x8(a6),d0    /x pos
     move.w   0xa(a6),d1    /y pos
     move.l   0xc(a6),a0    /la_sprite
     move.l   0x10(a6),a1   /save_blk
     linea    $0x000d
     unlk a6
     rts
```

ie check that 8(a6) and 10(a6) are in fact words, not longs.

If you plan to use the LineA often then I recommend getting more than one source of literature. All of them have errors. With three books you can just about work out where the errors are. "Compute's Technical Reference Vol 3" (the TOS one) is pretty good as far as they go.

> Another question I have is if I am able to combine VDI commands with

> somewhere that if a program uses line A routines then it cannot use the
> VDI nor the AES and must run as a TOS program with the .tos extension.

They can be combined but it is tricky. The basic problem is the AES and VDI treat the linea like a slave - both have licence to write anywhere they want, so combination with your own linea code relies on your ability to to keep restoring the data, which negates the speed advantages of using the linea somewhat. You are essentially being a cut down VDI. Again, unless speed is crucial, I recommend sticking to the VDI.

In the end, I completely rewrote the LineA bindings and they are now much easier to understand. I even wrote some linea font loading routines. I'll email the lot if you want to take a peek at the source code.

Hi. I'm writing a number of programs in C with a nice modern GEM interface (windowed dialogues, iconify etc.), and I am currently using GCC. However, all my previous GEM programs have been written in Prospero C, which has a number of non-standard function calls. (eg. objc_newtext() and objc_text())

I have managed to work out an equivelent piece of code for a number of the functions, but cannot see how to write an equivelent routine to either of these two:

```
char *objc_text(OBJECT *tree,int index)
                           /* IIRC? Not sure... */
```

which returns the text field of the given object in the given tree. and...

```
void objc_newtext(OBJECT *tree, int index, char *text)
```

which changes the text field of a given object.

Any ideas on how to do this? (I tend to use objc_newtext() a lot to change the value of status indicators etc.)

Cheers

Anthony

I do believe that you can use rsrc_gaddr to find the address of the
object and then grab the address of the text string from the record
defining the object. You'll need to pass rsrc_gaddr the number of the
object you want to change. I can't recall the exact details of the object
structure though, so you'll need to look em up.

I've found the problem. I need to name my file XXX.cc , not XXX.cpp. I've now managed to get it working but it is SLOOOOWWW. On my falcon with 4 megs of memory and running Outside (34Megs of virtual memory) it is unbearable! Perseverance is needed!

Very basically, it all revolves around a switch statement.

```
OBJECT   *ob;
char *p;

rsrc_gaddr(R_TREE,tree,&ob);
```

```
switch (ob[obi].ob_type)    {
     case x: /* TEDINFO (ie text) */
     p = ((TEDINFO*)ob[obi].ob_spec)->te_ptext;
     break;

     case y: /* STRING */
     p = ob[obi].ob_spec;
     break

     etc ..

     default:
     p = NULL;
     break;
}

return p;

>void objc_newtext(OBJECT *tree, int index, char *text)
>
>which changes the text field of a given object.

p = objc_text(ob,obi); /* or whatever */
sprintf(p,blah...);

/* assuming window is open, redraws all visible objects */
wind_update(BEG_UPDATE);
wind_get(handle,WF_WORKXYWH,PRECT(wr));
wind_get(handle,WF_FIRSTXYWH,PRECT(rr));
while (rr.w && rr.h)    {
     if (rc_intersect(&wr,&rr))
          objc_draw(ob,obi,MAX_DEPTH,rr)
     ;
     wind_get(handle,WF_NEXTXYWH,PRECT(rr));
}
wind_update(END_UPDATE);

Use this to size a single object and adjust the above redraw
accordingly ...

objc_offset(ob,obi,&rr.x,&rr.y);
rr.w = ob[obi].ob_width;
rr.h = ob[obi].ob_height;

You may have outside border problems because objc_offset() does not
take them into account. Depends on what you are doing really.

>Any ideas on how to do this? (I tend to use objc_newtext() a lot to change
>the value of status indicators etc.)

Using the redraw method ensures the objects are drawn correctly in the
background. You do not have to wait for a WM_REDRAW message before
walking the rectangles, it can be done at any time.
```

I assume from the function names that when you say "status" you are
referring to text. If you mean the state field then simply ...

```
ob[obi].ob_state &= ~SELECTED; /* clears selected */
/* redraw code above */
```

Perhaps something like this:

```
char *objc_text(OBJECT *tree, int index)
{
    switch (tree[index].ob_type & 0xff) { /* Mask off extended byte */
    case G_STRING: /* For all object types whose ob_specs point to a */
    case G_BUTTON: /* string, do this... */
        return (char *)(tree[index].ob_spec);
    case G_TEXT:    /* Ditto, for anything that has an ob_spec which */
    case G_BOXTEXT: /* points to a TEDINFO structure, do this... */
    case G_FTEXT:
    case G_FBOXTEXT:
        return ((TEDINFO *)(tree[index].ob_spec))->te_ptext;
    }
    return NULL;
}
```

> void objc_newtext(OBJECT *tree, int index, char *text)
>
> which changes the text field of a given object.

Pretty easy, given objc_text exists. Note there isn't any bounds checking,
I don't know if the Prospero version did any or what. (ie make sure your
new string doesn't overflow the space for the string in the resource.)

```
void objc_newtext(OBJECT *tree, int index, char *text)
{
    char *s;

    s = objc_text(tree, index);
    if (s)
        strcpy(s, text);
}
```

I'm not aware of any significant differences.

They are both 19in TT high (ECL) monitors made by different companies (Taxan?/
Phillips),
and badged by Atari.

```

:

The call

```
   objc_newtext(OBJECT *tree, int index, char *text);
```

should be aquivalent to

```
   strncpy (((TEDINFO *) tree[index].ob_spec)->te_ptext, text,
            strlen (((TEDINFO *) tree[index].ob_spec)->te_pvalid));
```

This line makes sure you don't write text too long into the field, but
does not check whether the string matches the validation string.

Cheers Peter

It depends with interrupt you wanna use. The most basic way is to switch to Supervisor Mode, then save the old interrupt vector, so your routine can properly return to the old routine, then write the address of your routine into the interrupt vector, and return to user mode. If you want to completely replace the old one, yours must end with an RTE instruction, which is hard to achieve in C. The other version is very tricky to do as well in C. For both I would strongly suggest to use assembler, at least for the binding to your C code. The fiddling with vectors in Supervisor mode can be replaced by a Setexc() call (this is BIOS).
Easily done (even completely in C) is installing a vsync interrupt function. This is because TOS provides an array where you can put the address of your routine, and it will get executed as a normal subroutine.

Whichever way you choose : Note that your new interrupt will be executed in Supervisor mode, and will also use the supervisor system stack, which is very limited !!! There is very little space for local variables, and virtually none for arrays or extended structures !

>

I never used Lattice C, I've got no idea whether it provides any help with such problems.

Cheers Peter

There is a Calamus modul available called "Bridge". This modul exports any Calamus file into a variety of different image formats including EPS und PS, you can even print on PS printers this way.

Hello,

Alain-Pierre DERENNES (Alain.Derennes@enst-bretagne.fr) wrote:

: Can anabody give me the differences between TTM194 and TTM195 monitors.

The TTM194 can be turned down to complete darkness, so you don't need a
screen saver. The TTM195's brightness can only be varied in a limited

range, but it seems to have a better contrast. I have seen only one example of each type, so I cannot tell you whether there are differences in contrast in within a production series.

Bye,

Kerstin

Have you tried the manuals?
There's not very much info in there, but they do mention that you have to use the __interrupt calling protocol modifier. Otherwise the function will be terminated with an RTS rather than the RTE needed for interrupt routines. I assume __interrupt also makes sure that all registers are saved.

For normal interrupt handling that should be enough, but the compiler also supplies the interrupt function with a special structure so that you can access the saved SR and PC (and other things, when available).

The sort of thing you want is this:

```
/*
*    copy the string from a TEDINFO into another string
*    usage:  get_tedinfo(tree, FIELDNAME, edit);
*    where:  global OBJECT *tree; global char edit[40];
*            and FILENAME is editable object in tree defined in RSC header
*/
void GetTedinfo(OBJECT *tree, int obj, char *dest)
{
    char *source;

    source = ((TEDINFO *)tree[obj].ob_spec)->te_ptext;  /* extract address */
    strcpy(dest, source);
}
```

and

```
/*
*    copy a string into a TEDINFO structure
*    usage:  set_tedinfo(tree, FIELDNAME, edit);
*    where:  global OBJECT *tree; global char edit[40];
*            and FILENAME is editable object in tree defined in RSC header
*/
void SetTedinfo(OBJECT *tree, int obj, char *source)
{
    char *dest;

    dest = ((TEDINFO *)tree[obj].ob_spec)->te_ptext;
    strcpy(dest, source);
}
```

x-mailer: Mozilla 2.0b6a (X11; I; SunOS 4.1.2 sun4c)

I've been trying to figure out how these work for an emulator i'm doing.
What i need clarifying is this:-

When the counter is at 01, what happens on the next impulse??
 - ST INTERNALS says somthing about changing the timer to the output of
it's pins ?, does'nt make much sense to me..
i presume it the resets the counter to it's original value ??, and
counts down again, or do you have to do this yourself??

secondly, what is the point of setting bit 4 of the control register to
produce a low reading. When exactly would this be useful and what
differences does it make.

Lastly, i've been running my emulator through the St's ROM (v1.0), the
code of this is also in ST INTERNALS which is helpful. I was wondering
what the code between FC0CE4-FC0D1E does, it's a small routine which
does what appears to be some mindless looping using Timer B, maybe
somone could enlighten me on that as well. I could always type the
routine in if nobody has reference to this book.

Thanks in advance, it would really help me if sombody could answer these
questions.

Paul Geary.

Yep, there is an excellent utility distributed by FAST Club (previously ST Club)
It converts between CVG/EPS (various formats of EPS). It really is good. About
14 UKP I think... Recommend it.

If I remember right there is a possibility to set the counter to
continuous or single-shot mode. The name says it all, I think. I'm not
sure though if the reset is done when the counter reaches 0 (as you
assumed) or when it goes negative (counting down from 0). I'd have to
look it up.

FAST Club in Nottingham England
tel: +44 1159 455250 fax: +44 1159 455305

I haven't spoken to them for some time but I think they are still in business...

Hope this helps, Exchange deals with a variety of EPS formats.

Well, I sure like that disease! Yes, of course I do program APL - as
everyone will keep on doing once he/she has seriously begun to learn the
language. However, I own only an old version of APL.68000 for the ST. If
anyone is willing to sell an APL2 license for the TT, I⌧d be interested.
(If the price isn⌧t L100: that⌧s what MicroAPL wants me to pay...)

Nowadays, I⌧m using APL2 for OS/2.

: for web browsing.

I'm using a Mega ST4 with CAB/STiK. 4 Colours isn't all tthat great, but
it works. Another solution is to use a program like Bigscreen and run
CAB in low res to get 16 colours and then just scroll around.

: Thanks.

Oh yes! :)
The manuals (5.06) mention how to do a normal function call, and thats it!

> There's not very much info in there, but they do mention that you have to
> use the __interrupt calling protocol modifier. Otherwise the function will
> be terminated with an RTS rather than the RTE needed for interrupt routines.
> I assume __interrupt also makes sure that all registers are saved.

My version of Lattice manuals (5.06) mentions that the __interrupt
modifier is legal but not doing anything (yet) :(

I have tried to inline an RTE , but I have this feeling that the startup
of the routine spoils the registers before I can tell it to save them all
(or at least the ones I intend to use.)

So the problem is how to do the bindings to the interrupt as an assembly
routine using the assembler included in the package.

Forexample: let an interrupt increment a global variable every milisecond,
and let the C routine access that variable {printf("%d",number);}
If I could come that far, the rest would be _much_ easier.

organization: Tariland Atari Computer Club, Auckland, New Zealand.
newsgroups: comp.sys.atari.programmer,comp.sys.atari.st.tech

I am trying to change the top process under MultiTOS. By "top process" I
am referring to the process which has a tick on it in the desk menu.

So far, I just look through all the windows until I find a window owned
by the process I want to top, then send a wm_top message to that process.
This works ok if the process has opened windows, but not if it only
displays a menubar and no windows.

Does anyone know of a universal way of "topping" any process, having the
same effect as selecting that process in the desk menu by hand?

I have been trying to find an answer to this question for some time, but
nobody seems to have any ideas :(Perhaps I have to use appl_tplay() to
simulate a mouse click in the desk menu?? How would I go about finding
out what position to click in the menu to choose the process I want?

Thanks for any suggestions!

Hi, just wondering if anyone can recommend to me ways to quickly get into programming for my Falcon. A friend and I are currently doing Amiga programs, and I'm eager to port some of these to Falcon (maybe STe where possible). I'm reasonably familiar with programming, but if you could all give me your (no doubt) differing opinions on which languages to use I would be most grateful. BTW, the games are basically 2D sprite/scrolling things.

Itching to start,

Jared

The question I have is how do I write a TSR which can link into an Interrupt in C?

When linking into the interrupts, is it possible to make the program both screen resolution and machine independant, ie. it will run on both an ST and a TT withoout to much effort in coding seperate sections for either machine.

All help on this issue is appreciated, especially any commented C source code giving examples ;-)

IMO you should use, on the Falcon, whatever language you have been using
on the Amiga. You will have enough bother converting system calls without
needing to learn a new lingo.

AFAIK all languages available on the Amiga are also available on Atari.

If you are REALLY FED UP with the language you are using on the Amiga then
start NEW projects with something else.

C seems to be the fave.

Its sad, but true :(((I was working with similar configuration for a
long time, but now I have installed a linux and gcc under linux runs
faster a bit and is also much easier to use and configure. I have also no

problem with getting the newest version (currently 2.7.2 --- exceptios
supported!) of compiler and debugger and I can make tos cross-compiler.
Its worth while.

> things.

Since it seems like you know the basic fundamentals of programming...
Start coding in assembly NOW !!!! Later on start on C, and then combine C
and Assembly.. In this way you will learn the instructions from the
computers view, and learn how to increase the CPU preformence.. ;)

Get started in Assembly by reading the book :

Introduction to Atari ST Machine Code.. (or something like this)..

And then get other 680x0 books.. Then you will learn it in a good manor..

Greets Jakob :)

<SNIP>

I've knocked up this bit of code, which gives you a timer B timer vector that
simply increments the contents of a Global int. This code was written off the
top of my head, so as to wether it works or not, I make no warrenty.
As I don't have a C compiler I can't test it, so if it don't work you're
own your own ;)

In the code I'm assuming that the stack will look like this:

```
sp-12 int timer b data byte (0x000000db)
sp-8  int timer b control byte (0x000000cb)
sp-4  int address of global variable
sp->  int return address

when Install_TimerB is called.

Check out my page for mfp info.

There is no interupt that normally is being fired each millisecond or even more often. You gotta setup an MFP timer and let that one cause interupts. If this resolution is not needed though, it might be even enough to use _frclock, which counts the frames displayed on the screen (Rate depends on resolution set.) If you could use that one you won't need any interupt programming at all.

Cheers Peter

I've encountered what seems to be a bug with TOS4.04, I was

wondering if anyone else had encountered it or could comment on it.

When programming a Desk Accessory and using the Windfind command I get a return of -1. The same program on a TOS 4.02 machine returns the appropriate window handle.

Comments? Suggestions?

Thanks,

Dan Ackerman

Well, are you sure you supplied senseful coordinates to wind_find? As this functions returns the handle of a window containing a given location on the screen, it may return -1 if there is no window to be found.

I'm running TOS 4.04 myself, and I haven't experienced any problems with my program Maus-Window, which uses wind_find extensively.

Ciao

Thomas

I'm not sure about that, but there is a collection of documentation available in english from a fellow in the US. It includes

- Pure C Help Files (in english)
- Complete documentation of Pure C menus, double clicks and hot keys
- Assembler and C Language references and tutorials
- Pure Debugger menus and window descriptions
- Complete descriptions of all library functions(except BGI, LineA, and VT52)
- Atari Memory Map and hardware descriptions
- ASCII, Scan Codes, data structures, file formats, examples, & more.

He was selling this at $50 US, but put it on half-price sale around Christmas. Maybe it's still on sale? You can reach him at

John Kormylo
9614 Oregano Circle
Houston, TX 77036

Or e-mail at J.KORMYLO@GENIE.COM.

It depends what programming language you are using now - if on the
Amiga, you code in C, then its probably best that you stick what the
programs are written in...

If you are using AMOS (do Amiga programmers still use this?) then you
might want to switch to STOS, and use my Falcon Extension....

>:and Assembly.. In this way you will learn the instructions from the
>:computers view, and learn how to increase the CPU preformence.. ;)
>
>which is necessary on the slow falcon?

Yes! As has been mentioned elsewhere, the bus is slow on the Falcon,
and to get anywhere near optimum performance in a decent graphics mode

you need to take this into account.

When the bus only has to handle 32k for a screen its not too bad, but
if you have 153.6k for a screen to update/draw every refresh it starts
to get overloaded...

Anthony

I have egg on y face now. Ifound my problem. When I was grabbing in all my support files, I ommitted to properly initialize the VDI. SO hence it had some serious problems. This does spark one question though. Why did it function fine under AES4.1 on one machine and not on the other?

re: Windfind

I do a vq_mouse to get the position before the call. The really odd thing about this problem is that it occurs on this one machine in both it's normal TOS and under MultiTOS, while on the other machine it works fine under it's normal TOS and the same AES version of MultiTOS. It doesn't really make any sense.

#>VDI. SO hence it had some serious problems. This does spark one
#>question though. Why did it function fine under AES4.1 on one machine
#>and not on the other?
Well, I guess that's because the VDI in TOS 4.04 is less forgiving that that found in older versions. (Remember: MultiTOS replaces the AES, not the VDI!)
Or maybe you've used NVDI on one machine, but not on the other.

But anyway: Don't mix AES- and VDI-calls for accessing the mouse. To get the current mouse position, either use graf_mkstate or use the values returned from an evnt_multi call (evnt_multi _always_ returns keyboard and mouse state, independent from the events you have specified).

Also, to switch the mouse on and off, use graf_mouse(M_ON/M_OFF, 0L) instead of v_show_c/v_hide_c (I know you haven't written that, but this is another common problem).

Ciao

Thomas

Thanks to everyone who's so far responded to me here, and via e-mail :)

At the moment, I'm most likely to go the C route. The games we've been doing are written in Blitz basic, with some in-line assembler (which I've been led to believe should be one of the easiest parts to convert), so I now have just a couple of other questions...

1) Are there game-type libraries around for various C-compilers to handle sprites, hardware scrolling, sounds and the like. If so, then will my choice of C compiler affect which libraries will work?
2) Not really another question I guess...Which C compiler (English language)?

Thanks again,

Jared

IIRC, wind_find should return 0 if no window is found (ie: the desktop)...?

'ello,

I've got a slight problem - can somebody enlighten me about how ltoa()
works. I have to write one due to it being missing in my compiler.
Better still, if somebody has the source for one then get in touch!

This is all I know ...

```
char *ltoa( int32, char*, int16_or_32 );
char *ltoa(val,dest,oo_er)
```

It converts 'val' into a string and writes it to 'dest' right? Is
'oo_er' the precision, maximum string length or what?

TIA

Interesting theory ;-) Well, a double bus fault leads to zero bombs (just halting the computer), so to this point the theory is right.

> 1 bomb = Reset
>
This one never occurs that way, it always directly restarts the computer.

> 2 bobms = Bus Error
> 3 Bombs = Invalid Instruction..
> and so on...
>
The latter is wrong :
 3 Bombs = Address Error
 4 Bombs = Invalid Instruction
 8 Bombs = Privilege Violation

You shouldn't use VDI functions if equivalent AES functions do
exist; use graf_handle() in this case!

(Or, possibly even better: use evnt_multi(MU_TIMER) with a null
delay - there are reports about strange mouse button problems
if graf_handle() and evnt_multi() are *both* used in the same
event loop...)

>The really
>odd thing about this problem is that it occurs on this one machine in

>It doesn't really make any sense.

Yes it does... :-)

Probably it's a bug in the Falcon's VDI; note that MultiTOS doesn't
contain a VDI - it simply uses the existing one, which would nicely
explain your observation!

Martin

You are right on your first two assumptions,

oo_er is called "radix" in my (MS)documentation. It's the base you want the output written in ie: 16 for hex, 2 for binary, 10 for normal base 10

Unfortunately this function is non-standard and may do whatever ... Have a look at sprintf before wasting too much work!

oo_er is the `radix', so I guess you can also use it to make binary (radix = 2) or hex (radix = 16) representations, for example.

When making your own, you can probably make use of sprintf().

Regards,

Hi!

I don't know much about the ST, but I'm hoping one of you guys does!
I need to know how to open and send data to the ST's MIDI Port using C.

If you know, please EMail me DIRECT at the address below. URGENT! :-)

Do you Lattice C?
If so, use stcl_d, stcl_h etc calls.

<HR>
</CENTER>
A blue ribbon is chosen as the symbol for the preservation of basic civil
rights in the electronic world.
<P>
EFF asks that a blue ribbon be worn or displayed to show support for the
essential human right of free speech. This fundamental building block of
free society, affirmed by the U.S. Bill of Rights in 1791, and by the U.N.
Declaration of Human Rights in 1948, has been sacrificed in the 1996 Telecom

Bill.
<P>
The blue ribbon will be a way to raise awareness of these issues, and for
the quiet voice of reason to be heard.
<P>
The voice of reason knows that free speech doesn't equate to abuse of
women and children, or the breeding of hatred or intolerance.

<HR>

<H4><B>All internet users are strongly encouraged to place a blue
ribbon graphic on their servers, such as this one below. </B></H4>

I'm making do with sprintf() atm, fortunately all the calls had 10 as
the radix.

There's been a change of plan!
Does anyone know how to do this using 68000 assembler?
Thanks again.

A null delay in evnt_multi() in a Desk Acc locks up the system under TOS 1.0. Not that I'm using 1.0, but I hate to write programs that will knowingly cause such problems.

But they are both using NVDI 2.5. The only functional difference between them under MultiTOS is that one has 14 megs and the other only 4.

Here is another fun question. When enabling OBJC_EDIT in a dialog in a window. How do you get it to work properly. I've been having problems with the cursor appearing outside the window or at the end of the box containing the edit field (Note end of the box not end of the edit field).

Hi,

my PureC (1.0) is behaving a bit strange: I have a program that combines C and M68K, and in both I declare some variables:

```
main.c:    void *buffer[80][2][10];
fdrsec.s:  .DATA
           FDsector: dc.w 0
```

If I now link these modules together, I get that 6400 bytes have been allocated for `buffer'--just as shd be--but FDsector (and other variables I defined in fdrsec.s) appear somewhere inside this buffer! In other words, suppose buffer points to 0x0000 and continues until 0x1800 (or whatever 6400 is in hex); then FDsector will point to, say, 0x0600. Clearly I get all kinds of problems with this.

Am I doing something wrong? (I checked everything I could possibly think of.) Or is this some bug in PureC? And how do I prevent this from happening?

Thanks in advance,

-- Jules

Hi,

I am having the following with a program I am writing to read/write Akai sampler disks, which are formatted slightly different from the Atari/MS-DOS format. I had to directly program the FDC--all (x)bios functions fail to read such disks--and finally got it working, but now I am experiencing the following problem.

When I, say, insert an Akai HD disk and try to read it from the desktop, I get `your output device is not receiving data'. When I run my program, it reads the disk just fine. However, if I now insert an

Akai DD disk and run my program, it fails to read it at all--HD disks work fine though. If I try to read the Akai DD disk from the desktop, I get the same error message, but suddenly my program will read only Akai DD disks--HD disks aren't recognized at all.

In other words, it seems there is a problem switching between DD and HD. Attempting to read the disk from the desktop solves this, but how do I do this from within my own program? Any help would be much appreciated.

Thanks in advance,

Hi Ben....no, it's not really been delayed (much). I wasn't happy with the performance of TOSWIN with it, so I'm cobbling together a replacement console window before the beta (you cann't run a desktop yet so you need the console to run programs from).

Does anyone know what MINIWIN does with it's resource file? It definitely has one, but it never calls rsrc_load(), or any of the other rsrc_ class functions for that matter - but it then goes on to call rsrc_gaddr() anyway. Any offers?

Craig.

I've had my old STFM for quite a while, but this is a problem that has always been with it, and I've just learned to live with it. I'd like to fix it though so this is the problem - in medium resolution, and occasionally low resolution as well, pixels on the screen flicker uncontrollably. This makes text very difficult to read - for example, when using Monst2, I have to use the 'faint' command to reduce the text size otherwise bits of the text are unreadable. On bad days, even the faint text suffers from the flicker. The flickering is generally not individual pixels but more often lines of about 8 pixels with little dots around it. The Ultimate Ripper when I had it for a while was essentially unreadable, and doc displayers (eg Revenge) suffered the same problem. Once, after using the computer for a few hours, I suddenly noticed that the problem had disappeared. I originally thought it was probably a dodgy tv modulator since I use a tv, but, having made up a scart lead the other day, the problem was not solved. (although the display was noticably improved by the scart lead). I thought it may be a memory problem, but the screen ram is perfectly steady. Opinions anyone? I suspect it is the video shifter which is causing the bother. How much are new ones and what expertise is requried to fit it. (I'm alright with a soldering iron and have opened my ST up plenty of times to clean it or fix the damned mouse/joystick ports).

: At the moment, I'm most likely to go the C route. The games we've been
: doing are written in Blitz basic, with some in-line assembler (which I've
: been led to believe should be one of the easiest parts to convert), so I
: now have just a couple of other questions...

: 1) Are there game-type libraries around for various C-compilers to handle
: sprites, hardware scrolling, sounds and the like. If so, then will my
: choice of C compiler affect which libraries will work?

Warwick Allison's C++ game programming library for GNU C++ seems quite
nice. You'll need _at least_ 4Mb to run GNU C++ and Warwick's library
is a bit old (no support for newer machines like Falcon).

:2) Not really another question I guess...Which C compiler (English language)?

Only free alternatives are SozobonX C
(ftp.fu-berlin.de (somehere like /pub/atari/programming/sozobonX))
and GNU C. With GNU C you need _at least_ 2MB of ram. Both of the
compilers are a bit 'unixy' to use.

Please will somebody help me use sozobonX I can't make it work even if I try
setting up environment wariables using a CPX CC.ttp can't find the compiler.
and if I try to run the programs by hand i.e. hcc, top, jas, and ld then when
I finally link I get _undef messages and a file called a.out is produced which
may be the beginnings of a program file but actually means 1 tenth of nothing
to me. I am learning C ant the moment on P.C's and I want to use the ST for
work. Partly cos I usually find it easier.
Thanks for any help
DAN

Use BIOS calls :

```
    Bios #1    int Bconstat (int dev);
    Bios #2    int Bconin (int dev);
    Bios #3    int Bconout (int dev, int databyte);
```

Use dev = 3 for accessing the MIDI port. Bconstat returns -1 ($FFFF) if data is present, 0 otherwise. Calls in assembly language shown for Bconout :

```
    move.w    databyte, -(sp)      ; Provide data for output
    move.w    #3, -(sp)            ; Provide port number for MIDI
    move.w    #3, -(sp)            ; Call function number 3 (Bconstat)
    trap      #13                  ; Do the BIOS call
    addq.l    #6, sp               ; Clear the stack
```

The other two calls look the same, just replace the function number; you find the return value in the lower 16 bit of D0 :

```
    move.w    #3, -(sp)            ; Provide port number for MIDI
    move.w    #2, -(sp)            ; Call function number 2 (Bconin)
    trap      #13                  ; Do the BIOS call
```

```
    addq.l    #4, sp               ; Clear the stack
```

Replace the number '2' in the second line by '1' in order to call Bconstat.

Cheers Peter

I'm trying to implement a menu option that iconifies the current window in an app.

This doesn't work too well because to do the wind_set(WF_ICONIFY) I need to pass it the iconified window's x/y/w/h (*not* the original window's x/y/w/h), and I don't know any of the values!

The usual iconification procedure just reacts to the GEM WM_ICONIFY message, which passes these coords to the app which simply does a wind_set(m[3], WF_ICONIFY, m[4], m[5], m[6], m[7]).

How do I find out the values to pass to wind_set?

I'm using AES 4.1...

I implemented a compleetely new Pack algorithm in 68020 Assembler on my
falcon. It is now in compleete test state, but it's running fast and
effective. Perhaps this could be a possibility to make a 030 only
memmory management for MinT whith online compression and swaping with
cache, etc.

I'm not too much confirm with the internal structure of MinT. Perhaps
someone could help me to get it in there.

Why don't you just slightly modify TOSWIN? If I've understood correctly,
XaAES has features that make it possible for TOSWIN to run without
being in busyloop and hence wasting CPU power for nothing.
I thought I would do this modification when XaAES would be available,
but of course it'd be great if someone else did it for me :-).

Very well observed! And solution is... none. Iconify was designed
to work only when the user clicks on the iconifier in a window name
bar. The best you can do is do your own alignment of icons along
some other side of the screen...

Anyway, don't bother writing for MultiTOS because nobody really
uses it...

No, it's just the way all programmers should do their things (including
Micro$oft). Optimum performance from the current hardware.

Everything else is feeble programming. (Programming in the dark, without
knowing anything about the machines architecture).

Keep Cool and Flying...

Ah, I think I know what you want now. Convert a string to a long integer
with optional change of base? Try the ISO/ANSI strtol and strtoul functions.

Does anybody know how notmem() should function. Mine appears broken in
that it bombs when given an odd address, so do I write a new notmem()
or come up with say Notmem() which calls notmem() after it's checked
the address is even.

I know this is of little relevence as allocation has to return even
aligned blocks but what about on a system where this is not the case?

I'm just curious :-)

Hi there,
 I'm trying to write a tsr program. What it needs to do is check for an input at the extra joystick port (STe), when it sees one it inserts a character into the keyboard buffer.

 The idea is to make a remote control for Cubase. Using switches (instead of a joystick) to activate the transport controls in cubase.

 I was thinking of using a desk accessory to install the tsr and then let the key assignments to be changed on the fly.

 Problem is where do I start? Does the joystick generate an interupt? I don't want to uses a timer to call the tsr as this may upset Cubase's timing. I'm using Prospero C (freebie with ST mag) but no manuals :(

 Any Help would be much appreciated, Mikey.

 p.s. Please could you reply my email as i don't get on usenet very often.

He was looking for the opposite, converting a long integer to a string.
ISO/ANSI/POSIX do not fully offer that functionality. Sprintf() only
handles octal, decimal and hexadecimal representation.

Hi,

does anybody know how to switch the FDC's clock speed from 8 MHz to 16
  MHz (to read HD disks) and vice versa on an MegaSTe? I guess there
  shd be a hardware register for this and this shd be listed in the
  Profibuch--however, I have an older version which doesn't include
  the STe series. Any help will be much appreciated.

The A.C is wrong! The vqt_get_table() returns a pointer to a linked list.
NOT to the lookup tables. If you are interested I'll send my CPX which uses
this call to remap the TrueType lookuptable so I can read Greek.
Keep in mind the NVDI, at least the 3.01 ver, does not support this call :-(
I wrote a patch which allows me to change the tables, but it's not the same

: PLEASE HELP !!!

If you want the C source of the CPX module just email me!

: Thanks

You are welcome

The hardware register (16 bits) is at 0x860e:w. Bit 0 determines
the clock speed (1 => 16MHz), bit 1 controls the drive (1 =>
density signal (pin 2) high).

Hang on, doesn't Magic allow iconifying windows? Or is that a different
protocoll (which would be particularly daft).

Hi,

My basic question is: Do I want to get Lattice C? I already have Pure C 1.1, but I find out that support for the latest TOSes (I have a Falcon) is not complete. I could of course hack my own function calls for stuff like VsetScreen() (and have done so) but this is not my favourite solution.

I spent the best part of yesterday trying to convert the XaAES logo program source form Lattice to Pure C. I had to make an rc_intersect() (luckily I could cut that from the EnhancedGEM

sources). I finally got it to work, but the logo is distorted and I get two bombs on exit. And this program is _really_ small...

So how does Lattice C (which is the only currently supported C, right?) compare to Pure C? Pure _used_ to produce faster, shorter code. But even stuff I program myself seems to be rather buggy under MiNT/MultiTOS. (Well, that could be my fault, of course...)

What I like about Pure C is its development environment (nice integrated help and stuff), its compiler speed, its code tightness and speed, and the integrated assembler. How does Lattice compare on these points? (_Is_ there an assembler or would I have to get Devpac?)

Lastly, is there some sort of upgrade path (HiSoft taking my Pure C originals and give some money for it :-) ?

Regards,

A new version of EXTRA is well on its way. There will be several new commands and of course the usual improvements. The fee is yet to be decided. If you can't wait then write to Top Byte (address in most Atari ST publications) and demand it gets sorted out NOW!

Owners of the existing EXTRA 3.00 will be given the option to upgrade to version 3.10 when it is released. Again, the fee has not yet been decided.

One of the commands to go is lextra. I am sorry because I am sure so many of you used it to its capacity but it had to go to make way for other commands ;)

Thanks you to all those registered users who completed the questionnaire. The feedback has been taken on board and is appreciated.

Martin Cubitt, author EXTRA extension.

I have written a packing/unpacking routine which is basically a simple
RLE type. It is very fast but VERY ineffective! Does anyone have good
compression source (68000 please) which I can use. Naturally I would
need the depacking code too.

I can be contacted on this newsgroup or e-mail me

  Tony Greenwood here, answering Tony Greenwoods quite reasonable questions :)

  I started TIMESLIPS nearly a year ago but the artist dropped out (its a game, hopefully to surpass my last release H.E.R.O.) its totally different, its BIG and has lots of new things, anyway no artist, now I have finally got an artist interested in the project and all the stored ideas are now being implimented, eerm trying :)
  Ready!, dunno, before summer hopefully,

  1 Meg Atari fm or STe, I dont see why I should make ste specific games or any other ste specific software just because I own one,

why would I want to ostracise < hmm is that spelt right? > half the atari owning public?

  It will be released as Public Domain as far as I am aware, I was robbed with my first attempt at making money out of my programming and you know what they say about "once bitten etc", it hasent put me off :)

   BTW I ahve just (tonight) finished the latest shell for WARP Diskzine issue 4, so AFAIK it should be out this week, I have sent it to the producer of the mag, hmmm maybe later as it is crimbo?

  Cheers.....!ynoT   http://www.airtime.co.uk/users/stosser/

Ummh, what relationship is there supposed to exist between the subject you choose and above question?

You find me thoroughly surprised at hearing there _are_ assemblers which

have a source line limit. All 680x0 assemblers I ever used and still use have no such IMO ridiculous restrictions (Alcyon, Quelo, MAS, gas).

I once, probably in a transient (I hope!) state of mental derangement, bought a C compiler package, where the assembler didn't know about forward references (Pure C). Never before did I trash a software that fast...

I upgraded my machine some years ago with TOS 2.06 from TOS 2.05;
On the feature side, TOS 2.06 has an inbuilt memory test, the Atari logo appearing on bootup; mybe some bug fixes I do not remember (the serial port drivers?)
But most importantly it is the first Atari TOS version to support 1.44 Mb disk drives correctly, which TOS 2.05 doesn't. So, if you want to install a HD drive or use one, TOS 2.06 is the choice. And - it runs on all 68000 Atari machines, detecting the type of machine itsself.
However, I hardly remeber all details, as I haven't seen TOS 2.06 for a long time. I am using Magic4 right now and recommend upgrading to this TOS version instead of TOS 2.06.

Regards,

Alfred

The definitive Atari Sysex software.

>Q Q When will it be ready?

Ooh, software release dates and all that...
I dunno. Weeks, months... as soon as it's decent enough
for release, really.

>Q Q Q What machines is it aimed at?

All Ataris with Midi ports.

> Q Q What type of release? ie pd etc

My first shareware proggie - but cheap, for what it does.

> Please reply in here rather than email, lets all talk !

I think programmers are notorious for not giving away too many secrets in
case someone else steals their thunder (and ideas :)

Anyway, I think there's plenty of mileage in rewriting old and useful
utilities to modern standards (multitasking OS, flydials etc etc)

Devpac from HiSoft I guess. I have it myself, and I can't remember any
troubles with huge sourcecodes. Devpac v3.1 is the best assembler
package available for the Atari (at least in my opinion). HiSoft is also
selling a Falcon030 enhanced version of it.

I have recently rewritten my GEM apps, and as part of that, they now
report unknown messages received.

Among the most frequent, I seem to see a message with value 1024 decimal

($400 hex) most often.

What is message 1024? How should I handle it?

From looking at the rest of the message data, it seems that msg[4] and msg[5] are a pointer to something. But what exactly is it a pointer to?

Using the sender-id in msg[1] and appl_search(), I find that it is usually sent to my application by Connect v2.46 and STZip 2.6 when they are starting up.

Ignoring it doesn't seem to hurt the overall functionality and stability of the system.

Is this message number documented anywhere?

Likewise, are there any other 'undocumented' messages I should be aware of?

I run a 20Mbyte TT with about 900Mbytes of online hard-drive, under TOS 3.05 and MultiTOS (with protection 'ON'). There's usually between ten and twelve megs of free RAM at the time those apps are loaded.

>I thought about introducing ICONIFY into some of my programs.
>Unfortunately I have very little documentation on the topic. A few
>questions :
First you need to include SMALLER in the window gadgets:

static int parts = (NAME | INFO | CLOSE | FULL | MOVE | SIZE | SMALLER |
UPARROW | DNARROW | LFARROW | RTARROW | VSLIDE | HSLIDE);

and an icon in your RSC file:
!rsrc_gaddr(R_TREE, FORM_ICON, &icon_form) ||

and then respond to the iconify messages in your evnt_multi loop:

```
case WM_ICONIFY:wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_shrinkbox(msg[4], msg[5], msg[6], msg[7], xc, yc,
wc, hc);
wind_set(msg[3], WF_ICONIFY, msg[4], msg[5], msg[6],
msg[7]);
wptr->iconified = OPEN; /*set a flag*/
break;
case WM_UNICONIFY:wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_growbox(xc, yc, wc, hc, msg[4], msg[5], msg[6],
msg[7]);
wind_set(msg[3], WF_UNICONIFY, msg[4], msg[5], msg[6],
msg[7]);
wptr->iconified = CLOSED; /*set a flag*/
break;
```

In your redraw window function (after moving etc) you need to either decide whether to draw the normal window contents or the iconified window:

```
while (box.g_w && box.g_h)
{
if (rc_intersect(&area, &box))
{
clip[0] = box.g_x;
clip[1] = box.g_y;
clip[2] = box.g_x + box.g_w - 1;
clip[3] = box.g_y + box.g_h - 1;
vs_clip(handle, 1, clip);
if (wptr->iconified == OPEN)
DrawIconWindow(handle, box, wptr);
else
DoDisplay(handle, wptr);
}
wind_get(w_handle, WF_NEXTXYWH, &box.g_x, &box.g_y, &box.g_w, &box.g_h);
}
```

Draw your Iconified window. I use the same icon for all the windows and change the icon text label to indicate which window it is. You might also need to cater for different aspect ratios (ie effectively med res and all others):

```
v_opnvwk(work_in, &handle, work_out);
short aspect_ratio = work_out[4] / work_out[3];

void DrawIconWindow(short handle, GRECT area, WIND *wptr)
{
char *dest;
short x, y, w, h;

wind_get(wptr->whandle, WF_WORKXYWH, &x, &y, &w, &h);
dest = ((ICONBLK *)icon_form[ICON].ob_spec)->ib_ptext;
strcpy(dest, wptr->icon_text);
ClearArea(handle, x, y, w, h);
HideMouse();
icon_form->ob_x = x;
```

```
icon_form->ob_y = y;
icon_form->ob_width = w;
icon_form->ob_height = h;
icon_form[ICON].ob_x = w / 2 - icon_form[ICON].ob_width / 2;
if (aspect_ratio == 2)
icon_form[ICON].ob_y = h / 2 - icon_form[ICON].ob_height;
else
icon_form[ICON].ob_y = h / 2 - icon_form[ICON].ob_height / 2;
objc_draw(icon_form, ROOT, MAX_DEPTH, area.g_x, area.g_y, area.g_w,
area.g_h);
ShowMouse();
}
```

I don't bother with ALL_ICONIFY as it's a bugger not worth the effort IMHO.
Hope that makes sense and helps!

It is doubtfull I am afarid, I send it to the editor of the zine, he then releases it to such pdls as floppyshop, goodmans etc, I cannot upload with this software so, your best bet is the pdls, theres 4 isues of WARP and they are all Public Domain,

Messages unknown to an application should be ignored, not their receipt reported (see below).

> Among the most frequent, I seem to see a message with value 1024 decimal
> ($400 hex) most often.
>
> What is message 1024? How should I handle it?
>
Dunno what just that message does ('d have to look up). It's probably requesting if your software knows about some protocol. Since your application doesn't know it should ignore the message.

> Ignoring it doesn't seem to hurt the overall functionality and stability
> of the system.
>
That's how it works : No response just means the receiver does not support that specific thing.

> Is this message number documented anywhere?
>
Sure, read the docs of this particular protocol. ;-)

> Likewise, are there any other 'undocumented' messages I should be aware of?
>
Unless you wanna implement things like VA-protokoll, or Drag'n Drop you don't need to know about those.

Are you sure you use the names specified by Atari ? I thought the name was ICONIFIER, rather than SMALLER, also CLOSER, FULLER, MOVER, SIZER

Anyway, thanks a lot for your source code.

Cheers Peter

Why does it have to be in the bootsector ? A normal (small) program being
physically (!) the first file in the main directory should do just as
well.

Cheers Peter

The word at location $440 contains:

0 6ms
1 12ms
2 2ms
3 3ms

Reuters, making loads of money on contract...

> Q   Q   Is there anyone out there programming,?

You should see my mailbox....loads of people.

> Q   Q   What are you programming,?

I've just released CLAv3 (electronic CAD & simulation).
I've got a new release of DUftp (mint-net again) almost ready.
XaAES (although a little late - sorry) is coming along nicely, and I
do promise to actually let a select few get their mits on it RSN.

> Q   Q   When will it be ready?

see above.

> Q   Q Q   What machines is it aimed at?

Well, DUftp is an 'any with MiNT+MiNT-net'
CLA runs on anything, but better in high-res/loads of colours (I wrote it on a falcon).
XaAES has only been tested on a falcon so far, but should run on any machine with MiNT.

> Q   Q   What type of release? ie pd etc

CLA is shareware (I've been working on it for 5 years now of and on).
DUftp is PD (I did a source release of it as well).
XaAES will be released under the GNU Public License as source & binary.

I have a beta version of Telnet that is almost ready for release, but I am looking for beta testers. I'd like to know what the Atari community thinks before I upload it to all the various sites around the world.

So, if you want to have a copy, there are two terms to the contract:

1) You _must_ tell me what you think. Please e-mail me at jbaumgar@coil.com
2) Don't distribute it yourself. I realize that no security precautions have been taken by me, but please don't. I only want people who are interested in beta testing to use it for now. There will be an official release available in a week.

The file is located at http://www.coil.com/~jbaumgar/ai.html

Thanks!

On 30 Dec 1995, Craig. Graham wrote:

> I've just released CLAv3 (electronic CAD & simulation).
>
Fetched that release, and tried to run it. Directly after startup NVDI
tells me "Invalid handle". Two choices : "Continue" or "Tolerate", one
crashed immediately, the other later on. CLA obviously relies on the
effect of Atari-VDI that wrong handles don't neccessarily lead to
problems (Mind you : This is a bug !)

The plain computer of course does run it, but CLA involves lots of
graphics, and this is painfully on a 12 MHz maschine without NVDI.
I'd try CLA again, when the improper VDI handling is cured.

> I've got a new release of DUftp (mint-net again) almost ready.
>
I liked very much the idea of DUftp. I must point out that I really like
the way Xwindow window manager display the GUI. And I also like the
appearance of GEM. But mixing it up (like having a program with Motif
look running in a GEM environment) is to me as ugly as almost nothing
else. Please, Craig, go a little bit more for the style guidelines.
I'd love to have a program like DUftp with a decent GUI. Is the gui
hardwired into DUftp ? Or is there a way to cure this ?

> XaAES (although a little late - sorry) is coming along nicely, and I
> do promise to actually let a select few get their mits on it RSN.
>
I's love to check this one myself.

Please, Craig, don't take my critique personally, you've done a great
job, but without people citicising programs hardly get better.

Cheers Peter

These are defined as such in my Lattice C header files. It is SMALLER in The
Atari Compendium.
I did wonder at the reasoning behind 'SMALLER' TBH ;-)

>Anyway, thanks a lot for your source code.
No problem. Hope it helps. Email if you don't understand anything.

---------- 951231
Info about the Jaguar Server.

Current hardware revision B.
BootROM B001, JagOS version 1.07

A | in front of a line means that some new stuff
has been typed in there since the last info file...

The Jaguar Server project started out in August '94. The goal was to make a cheap developer kit for anyone that wanted to program for the Jaguar. Atari's own developer kit was $5500 and that was WAY to much if you just wanted to hack and program the Jaguar just for the fun of it.

The very first prototype was built around the Mega ST's 'MegaBus' All of it was hand wired together using a total of 21 IC's. I can tell you that this board had VERY little empty space on it.. This prototype was soon scraped, as i begun work on the Rev A board, using a different approach this time. It was built for the cartridge port and could then be used on all Atari computers not just the ones having a 'MegaBus'.
To keep the cost down, i also decided to use the Jaguar's 2MB main memory and not include any expensive RAM chips in the Jaguar Server hardware.

The Rev A board was up and running with very simple software in Februari '95. As the Rev A board had some small flaws, i made some changes to the layout and came up with the Rev B board.

More serious work now begun on the Software - The Shell running on the Atari computer and the JagOS - Running on the Jaguar.

General Info.
---

* Use the Jaguar Server kit to develop Jaguar programs !

* The Jaguar Server runs on all Atari ST/STE/Falcon/TT computers.

* The hardware plugs into your computers cartridge port. From the cartridge hardware goes a 40 pin ribbon cable into the Jaguar.

* Uses a slightly modified standard Jaguar. You send our Jaguar to me for modification, and i'll send it back to you.

* You can change betweeen 'modified' and 'orginal' Jaguar by the flick of a switch. A reset button is also installed. ABSOLUTELY _NO_ compability problems with Jaguar games.

* No programing restrictions apart from a 2Mb main memory limit in the Jaguar. Future software updates will be able to upload data at the command of a running Jaguar program.

* You use the Jaguar Server software to upload programs/data to the Jaguar. The software looks best in resolutions over 640*400.

* Software updates to JagOS (Jaguar Operating System) are possible without burning a new EPROM chip simply by using newer software.

| * Upload transfer rate is currently 83 Kbyte per second on a 8 Mhz
| Atari and 131 Kbyte per second running at 16 Mhz.

* Use the Devpac 3 assembler or any other code generator to write programs.

* A remote debugger is under development.

* Software updates and info are availible on InterNet World Wide Web at http://www-und.ida.liu.se/~t94patsa/jserver.html and by filerequest with any FidoNet compatible mailer to STacken BBS on FidoNet 2:204/219 under the magic name JSERVER

* A Jaguar Server Developer Mailing list are availible for programming discussions. NOT open for anyone. E-mail to nat@zumdick.rhein-main.de for more info

* The Jaguar Server development kit contains this...

  + Jaguar Server cartridge (hardware)
  + Jaguar Server Shell & JagOS (software)
  + Switches, ribbon cable, connectors and everything else that you need to start programming right away.
  + A few Jaguar (*.JAG) programs and example source code.

* IT DOES _NOT_ CONTAIN THE FOLLOWING... You have to get these things yourself....

  - No 68000 or Atari RISC assemblers.
  - No Jaguar technical documentation.

```
  * 'Hacker' experience and good knowledge of assembler programming
    is STRONGLY recommended because of lacking Jaguar technical
    documentation.

  * The Jaguar Server is NOT connected to Atari Corp. in ANY way.

  * _Introduction_ price is :

            3400 Skr
|            730 DM
|            330 GBP
|            510 USD for the Jaguar Server and a new Jaguar console
                    (Swedish PAL without game!), modified and ready
                     to be used directly.

             1500 Skr
|             325 DM
|             145 GBP
|             225 USD for the Jaguar Server and modification.
                     You send your Jaguar to us...

Shipping is NOT included in these prices and will be added!
Around 200 Skr for shipping is normal.

----------------------------------------------------
Some technical info.
----------------------------------------------------
  A Jaguar (*.JAG) program is built around a header. There are
  currently five different headers, each with it's own use
  and advantages depending on the development environment and
  programs.
  For example, one of the headers looks like this (for Devpac 3)

  *-----------------------------------------------------------------*
  * Standard JagOS 3 Upload & Run parameters.                       *
  * ? Roine 950420                                                  *
  *-----------------------------------------------------------------*
    OUTPUT i:\*.JAG          * Output standard Atari Executable.

  down    EQU $5000          * Download adress in Jaguar.
  start   EQU $5000          * Program start adress in Jaguar.
          OPT D-           * No debugging info.

          dc.b 'JAGR'        * Magic to skip Devpac Header.
          dc.w 3             * JagOS 3 - Recive & Run.
          dc.l down          * Download adress.
          dc.l c_end-c_start  * Lenght of Jaguar Code.
                             * A dc.l 0 are also possible.
          dc.l start         * Start adress.
          ORG  start         * If position dependent code.

  *-----------------------------------------------------------------
```

```
  c_start                     * Jaguar code start.....
          NOP
          NOP
          ILLEGAL             * Not much of a program...  Hmm...
  c_end                       * Jaguar code end.
  *-----------------------------------------------------------------
          END
```

Jaguar Modification

As there has been some trouble with users installing things wrong when modifying their Jaguars to accept the Jaguar Server Development kit, I have decided to NOT to let users do this modification on their own any more.

I really think that this solution is the best for both parts.
This means that the Jaguar Server Development kit will work when you get it, just plug it in the computer and start programming and i will get happy customers with working kits!

This means that you now _MUST_ send us your Jaguar console and i will do this modification for you. This will ensure that the modification is correctly done and working 100%
It is also possible to order a complete new Jaguar Console (PAL) if you for some reason cant send your Jaguar to us.

Misc Info.

If you have more specific questions or want to order,
write me by E-Mail...

Bah!

I've just spent the whole night debugging some code only to find shellsort() had failed. Is there a size limit for this function (32/64k?) or is my implementation of it broken (MWC 3.0.9). Replacing it with qsort() removed the fault immediately (duff addresses into the comparison routine no less!).

TIA

Fraggin' heck!

I apologise for that it was supposed to attach a file not quote
to kingdom come...

Very sorry!

What was supposed to go out was a plea to ANY Atari ST Doorgame
authors either past or present to send me info on their products
so I can compile a list of currently available doors available
to sysops like myself... What I am trying to do is sort out which
doors are still supported, which aren't, and update people on the
location to send donations too.

If you are/were a door author please drop me a line with:

>< Doorgame(s) along with last/latest revision number.
>< Shareware Status (expired/no longer supported/donation amount)
>< Your Name
>< Support BBS Number (if applicable)

>< Your Address if you are still accepting donations/support.

Thanks...

If I remember correctly, shellsort() is a recursive implementation, and
therefore can require a significant amount of stack space, depending on
the number of elements to be sorted. With MWC you by default get a limited
amount; you can increase it by setting a global in your program (I forget
the name, something like _stacksize). Since by default MWC doesn't check
for stack collisions, your data and stack segments probably collided. Not
pretty.

qsort() is not a recursive algorithm, so it doesn't have the same space
requirements even though it has the same calling convention. I don't
know for sure which is faster on MWC.

That would of course depend on your implementation.

>>(32/64k?) or is my implementation of it broken (MWC 3.0.9). Replacing

Shell sort, if correctly implemented, works, naturally. It wouldn't be
very useful as a sorting algorithm otherwise. ;-)

>>it with qsort() removed the fault immediately (duff addresses into the

>If I remember correctly, shellsort() is a recursive implementation, and

While it's perhaps possible to write a recursive shell-sort, that would
be very strange.

>therefore can require a significant amount of stack space, depending on

Shell-sort is actually one of those very nice sorting routines that
don't require any extra space (apart from a couple of integer variables).

>qsort() is not a recursive algorithm, so it doesn't have the same space

Quick-sort normally _is_ a recursive sort, although you could of course
write a non-recursive implementation. You'd still need some kind of
stack, though. The size of the stack would be proportional to log(n) IIRC.

I don't think the ANSI standard defines what kind of sorting algorithm
is actually used by qsort(). shellsort() is not an ANSI defined function.
Shell-sort and quick-sort are usually rather similar in performance.

The MWC manual says exactly the opposite - it's normally rather good.
The fact that qsort() worked and shellsort() did not, should have lead
me to that conclusion. I'll go check...

Unexpected result - No, it wasn't the stack :-(

Test code in shellsort() comparison module:

```
int
Cmp(a,b)
char **a,
     **b;
{int dummy;

 if ((long)&dummy <= (_stksize + 1024))   abort();
 return strcmp(*a,*b);
}
```

I also increased _stksize to 128K just to double check. No joy.

Everything seems to work until the last comparison whereby 'b'
contains garbage - in fact the value looks like it could be the
consequence of a stack overflow. Wierd.

I'll have to try and duplicate it under more debuggable circumstances,
preferably with a file smaller than 300K!

I have the atari assembler editor cartridge. I have been trying to
figure out how to load the MSB and LSB into the accumulator using labels.
ex:

```
     lda <NAME
     sta XXXX
     lda >NAME
     sta XXXX
NAME .byte "Hello"
```

I have seen this wording in magazines, however I get an 'ERROR - 6' when
the assembler runs through 'lda <NAME'. Does anyone know the correct
syntax to use for this?

qsort *is* a recursive algoritm. But stack requirements may vary according
to implementation.

More precisely a textbook description of Quick Sort is recursive. This
does not mean that implemented as a qsort() function it has to be done
that way. Actually it is pretty easy to make it into an iterative
loop. This means that you have to maintain your own stack explicitely
but, with a properly done qsort(), on 32-bit machine you need something
like 16 cells long array of pointers (give or take a pointer or two)
for that purpose. A "naive" qsort() implementation is very good, and
important too, for a Computer Science 101 course but not for a decent
library.

I have no idea how qsort() is done in MWC libraries.

Hello
there

I was going to email you concerning the Jag-server, You can certainly put me down for
one.

As long as I can program it with a STE. Then that will be a great step for
in the games or other type of programs that can be used on the
Jag

Derek

The manual says recursive. There is no source code provided for either

method which is a shame. I wouldn't mind seeing some though. If I'm
going to looking at the machine code then a basic idea of how they
both work will certainly help!

Quick sort is conceptually very simple:

- If there's only one element, the list is sorted, otherwise:
 - Select an element, for example the first one
 - Divide the rest of the elements into two groups,
    one for values that are larger than the selected one and one for those
    that are smaller (it doesn't matter where the ones that are equal go)
 - Quick sort each group (by applying these steps recursively
 - Put the two (now sorted) groups back together, with the previously
   selected element in the middle
 - The End!

Implementing this is a lot easier in some languages than in others.
C is one where it's not entirely straight-forward, so I'll skip that.
Let's leave it as an exercise for the reader. ;-)

Shell sort is far from as simple to explain, so I'll just give a working
example for you to examine.

```
void swap(int *a, int *b)
{
   int tmp;

   tmp = *a;
   *a = *b;
   *b = tmp;
}

/*
 * This code is a quick conversion from a BASIC program
 * =>  The array starts with element 1
 */

void shell(int *d, int n)
{
   int inc, l, ps;

   inc = n;            /* lots of variations */
   while (inc > 1) {
      inc /= 2;        /* lots of variations */
      for(l = 1;l <= n - inc;l++) {
         if (d[l] > d[l + inc]) {
            swap(&d[l], &d[l + inc]);
            ps = l - inc;
            while ((ps > 0) && (d[ps] > d[ps + inc])) {
               swap(&d[ps], &d[ps + inc]);
               ps = ps - inc;
            }
         }
      }
   }
}

void main(void)
{
   int elements[17] = {0,2,6,3,7,2,9,1,2,7,4,4,2,6,0,2,1};
   int n;

   shell(elements, 16);

   for(n = 1;n < 17;n++)
      printf("%d ", elements[n]);
   printf("\n");
}
```

I hope that helps.

As I see it, 'C' problems comes in three flavours:

1) System related (in this case TOS etc). c.s.a.p will be the best group to hang around no matter what language you are using.

2) Compiler related (Lattice x.xx). Hmm .. Lattice has a product for the Amiga as well, but I still think that if you use an atari then c.s.a.p would be appropiate for questions and opinions on programmingtools.

3) 'ANSI-C' related. GOTO comp.lang.c.moderated

Yes, there definitely *is* a nasty bug in Mark William's shellsort()
that limits the effective array size to (IIRC) about 32 K: after
calculating the offset of an array element (using the `muls' operation),
the resulting value is sign extended to 32 bits - which is utter
nonsense, since `muls' already returns a 32 bit value!

One way to fix it: extract shellsort.o from libc.a, find exactly four
occurences of the sequence

```
   0x48c0       ext.l d0
   0xd08d       add.l a5,d0
```

and, using some kind of hex editor, replace the `ext.l d0' by

a `nop' (0x4e71)...

I tracked this down a few years ago when a user of a file selector
I was hacking/maintaining at that time complained about crashes
when opening directories containing more that 1000 file entries... :-)

Strange. I've not had that problem myself, and I use NVDI all the time. I
did try to ensure things worked OK (and did have quite a large number of
testers with various setups from a 1Meg STE through falcons & TT's, right
up to a PowerMac with MagicMac), and no-one had reported it. Oh
well....perhaps you should have mailled me a bug report?

When used with NVDI or Enhancer, CLA3 speeds up a lot as it makes use of
off-screen bitmaps to speed up the display.

?????I'm sorry, but I don't follow you here. The only thing about DUftp
that isn't quite standard is that the scroll bars are on the left for the
remote & local file lists. Everything else is modern standard GEM. A menu
bar, a couple of non-modal dialogs, one or two editable text fields, a pop-up
menu or two....nothing non-standard about that. The drag & drop handling is
standard as well...it's certainly nothing like Motif.

> I'd love to have a program like DUftp with a decent GUI. Is the gui
> hardwired into DUftp ? Or is there a way to cure this ?

I know the GUI isn't perfect, but it's not that bad. Better give me some
real examples here, as I don't see a problem myself.

> Please, Craig, don't take my critique personally, you've done a great
> job, but without people citicising programs hardly get better.

Not personally, but at least in the case of the DUftp comments, puzzling.

Right here. There's a few of us about :)
DUftp was written in Lattice C (I think it's just about the only bit of
MiNT / MiNT-net software that has been so far). CLA is also done with
Lattice, as is XaAES.....

Craig

Hi !

Could anyone tell me, how to install an alternative filesystem on harddisc that supports long filenames and an unzipper to unpack Gnu C properly ? With my current setup, some files are overwritten during extraction.

I heard something about newer GEMDOS supporting such filesystems and a filesystem called minix, but I don't know exactly what this is all about.

Any help would be appreciated.

Eddi

Well, the suggestion to do these things came from a german magazine; the details, however were for the 1040 STF(M). For other systems (like my 520 ST+) you'd need circuit diagrams in order to find the places of several components and soldering joints.
Since it was published in german I think few people outside Germany have build this. You'd have heard of it in the german Maus Net.

Sorry, little mistake of mine, some VDI ESCape variables are changed.
They don't exist on maschines like the TT, Falcon, Medusa, Eagle ...

You're right, it would be possible to read the variables. My point was that it's impossible to take all hardware configurations into account.
And a hardware hack like this one on a Medusa (dunno if that makes any sense) for instance would be quite tricky to detect without VDI.

> I dont know if they do, but shouldn't graphics cards put a cookie in the
> jar to make it easy to detect what resolution it is???
>

Would have been good, it Atari had initiated this; but because they did not, there is no standard for it, and every graphics card driver has it's own cookie name, so you gotta know all of them in order to get things to work on all maschines.

Cheers Peter

Hello,

I have had some problems with deleting files and folders on big machines (convex, hp, and co...) a few years ago. The solution i found is the following:

- go to the level where your folders are (supposing they are on the same level; if not, repeat the solution)

- create a folder on the level above:
    mkdir ../toto (for example)
- move all folders (those you want to delete, and the others) and files of the same level in this folder:
    move * ../toto
- go to toto:
    cd ../toto
- move files and folders you want to keep in a safe place
- delete the folder toto:
    rm -fri toto

With this solution, you can delete files and folders create in bad ways or with bad name and so on.If you can't move your folders, it's another problem such as protection, permission of writing, ...

Regards

thinking
>about upgrading.

From what I understand, they are the same, except that 2.06 is downward compatible with older Ataris (this is from the documentation with my TEC card). Such things as being able to turn the blitter on and off, and being able to switch from 8 to 16Mhz, are disabled in 2.06 when it sees that it's running on an older machine.

Does there exist any C code to fiddle with the modem port on the Falcon like on the ST(e)? I mean, rsconf() does almost nothing now, and I don't know how to detect a carrier signal any more or anything :(:(:(I don't know how to read ASM, which is what most of it is in. Help help?

You don't need write permission for an object to remove that object.

> you might also
> have to do this to the directory which _contains_ the directories you
> want to delete.

That's what you need, write permission for the directory which contains
the object.

If necessary, you can invalidate the i-nodes and than run fsck, this
is normally the way fsdb(8) works, but it doesn't exist for minix.xfs
under MiNT.

> Am I missing something really obvious here, like permissions or user privileges?

Maybe, try `chmod -R o+w .' .

Hello,

I've seen on a Mac that Dungeon Master II exists, and seems excellent: very nice graphics, and great improvments comparing with DM I (for example, you can go outside).
Does anybody know if it exists on Falcon 030, or will exist?

Thanks,

But what about when you've got a full-justified block, and you need to position the cursor ? How on earth do you find the character it's on if you`re justifying
using the VDI text functions ?

Maybe the directory attributes don't include 'w'-flag (r-xr-xr-x). Try
'chmod' to change these flags to 'rwxrwxrwx'.

There is NO disk-editor etc. to change the 'low-level'-data of
MinixFS-partitions! This is only possible for plain TOS-partitions!

Maybe you should use 'fsck' to check the integrity of the Minix-Parition
too.

Ciao... Arno

: TOSWIN or even use a smaller shell (tcsh is rather larger).

2MB is tight for GNUC. THREE_POINT_FIVE (3.5) MB is tight for GNU C++. If you really want to compile C++ code in 4 MB, use the smallest, nastiest shell you find, and do not load TOSWIN or GEM.

: > if it's not possible to use gnu c++, is there another c++ available for

Hi,

I have a small problem regarding _reading_ and _writing_ files using
HiSoft Basic 2. I believe the problem occurs with other Basic's as
well (and perhaps other languages).

Just to get familiar with HiSoft BASIC 2, I wrote the following code:

```
data$=""
OPEN "analogue.sys" FOR INPUT AS #1
     INPUT #1;data$
CLOSE #1

OPEN "test.sys" FOR OUTPUT AS #1
```

```
     PRINT #1;data$
CLOSE #1
```

In my opinion 'test.sys' would have been an exact duplicate of 'analogue.sys' but it isn't. In fact 'analogue.sys' is 8393 bytes long, and 'test.sys' is 76 bytes long.

Just some details about the files. 'analogue.sys' is a synthesizer patch dump (also known as System Exclusive), and it contains ASCII codes from 0-255.

I assume my program runs into a 'end of file' code. But how do I write my code to read the complete 'analogue.sys'?

I'd be most grateful if antyone could help me with this one.

Carl.Lofgren@abc.se

Install the HSMODA package and use Fcntl(2). The desription of the Fcntl opcodes supported by HSMODA can be found in sersoft.txt (german and english).

I can shed light on this one - the TERMCAP variable that TOSWIN sets
does not have all the entries - I have this fixed at home (which is
3000 Km away right now). I will be back on Jan 10 and I can post the
fix then - it simply means setting TERMCAP yourself in your
tcshrc.csh (or whatever your version of tcsh uses). You need four
additional entries for up, down, left, and right. I figured
it out by just looking at other termcap entries so you may be able
to do the same. I was going to try an update TOSWIN for AES > 4
features and fix small things like the termcap entry.

Good Luck,
Sam

Hi Carl,

Though this has nothing to do with Basic :-)

Have you made your Rev.D/C Falcon run at 36 Mhz now ??

Mine is running both 36 and 40 Mhz, much more stable than before. 36 Mhz is 100% stable!!

Keep Cool and Flying...

: card). Such things as being able to turn the blitter on and off, and
: being able to switch from 8 to 16Mhz, are disabled in 2.06 when it sees
: that it's running on an older machine.

As far as I know TOS v2.06 also have some bugfixes. My opinion is that
it's worth upgrading from v2.05 to v2.06. Another option would be to buy
MagiC. You'll not only get a faster and bugfixed OS, you'll get a
multitasking one too.

FWIW VRAM also requires NVDI to work with TOS 4.x, presumably in order to
use blitter-free code.

 The language is Hisoft Basic 2 and there is no 64K limit on string length.
There is a limit,(2^31-1) or (2^32-1), I forget which but you need at least
2Gigs of ram to reach it. :) You are correct, It is inputing into a string.
This is a very efficient way to read large chunks of binary data.

1: There is absolutely no problem in disabling the blitter on Falcon.
2: VRAM defines the virtual memory as TT-RAM, hence so problems with blitter.

AFAIK the blitter can't be used on TT-RAM.

>These folders are not corrupt, as I can copy in & out files.

I've come across one obscure situation where this can occur, which no-one
else seems to have mentioned yet. (I'm assuming you've using MiNT and
MinixFS to access your Minix partition.)

MiNT protects against any directory being removed if that directory is
the currect directory of any process currently in the system. Check that
you haven't got any stopped jobs whose current dir. is the one you're
trying to delete.

This can happen if, for example, I go into directory foo, 'less *' to
examine the files, Ctrl-Z to stop less, then I forget about the less, and
eventually decide I want to remove the directory and all its contents.
I then get 'access denied' messages when I 'rm -rf foo', reminding me to
check for stopped jobs. As soon as I kill off the 'less', I can remove
the directory.

Hope this helps...

>using the VDI text functions ?

Aaah! There you've put your finger on the sore spot. To tell you the
truth, I don't know. I think the only way is to do my own
justification and keep track of the offsets. Which is really a shame,
as it will probably slow down my output routines too.

Or - something I just thought of - if I set the justification routines
to `stretch spaces only', and devide the difference between the full
width and the unjistified line width by the number of spaces in the
line, I know by how much each space is stretched. I'll have to do
some experimenting to see if one-off cursor positioning (which will
probably happen in that case) is something that can be lived with.

Hmmm.

Regards,

When I used rm -rf the folders were zapped, great.

Thanks to all who replied.

I never found the "-f" option explained in any of the documentation that accompanied the miNT-kit. I had previously used the rm -r option.

Is there a book (or a file) that explains all of the various Unix commands & options available?

Do it right - use the

```
     BLOAD filename$,address
```

command. This is a shit load faster than using input.
use VARPTR to get the address of a buffer to load into.

Or, if you want to load in segments, use the LIBRARY"GEMDOS" functions for doing
file i/o.

Craig.

A big difference. Apart from stacks of other things (128,000 words, 340
pages, 101 tables etc) The Atari A to Z has full details on all the machines
and TOSes.
Only available from me and cheap!
Email me for further details.

I don't think you'll have any luck. On AIX, the -f option means the
command won't prompt for removing write-protected files, but it does not
affect the ability to do so. You see those option mean slightly different
things from Unix to Unix. Its better to get the proper man pages for your
specific implementation. My suggestion is to aquire the "manual" section
of KGMD, which AFAIK features a rather complete set of man pages.

Hello, people!
     I have beren struggling for a while to set up
Gnu c++ on my falcon (MultiTOS, Outside and hard disk).
Is there a fools guide to setting up Gnu C on a TOS partition,
including a list of libraries and instructions on make files?
I would like to start C++ development on my machine ... I'm fed
up of programming for windoze at work! If there isn't any such
instructions file to make life a little easier, maybe someone

ought to consider putting their experience to some good use.
    Also, does gnu c support some of the more recent C++
additions such as templates?

What about a AfterBurner040, it's suppose to make the 486DX2 look like a old
ZX81 :-)
It performs a mere 1000 % in RAM-access (!!!!!) when running a program in FastRAM
(GemBench results.) compared to a 16 Mhz 68030 Falcon!

> c> Mine is running both 36 and 40 Mhz, much more stable than before. 36 Mhz is
> c> 100% stable!!
>
> How much faster does your Falcon _feels_?

It feels quite snappy now, especially when running MagiC 4.

But old MultiTOS also runs quite acceptable now, compared to the crawling speed
before I got the FastRAM.

There is a BIIIIIG difference in performance, when running in 36 Mhz with FastRAM
in 256 colors on the desktop. I'm always running in 800x600 in 256 colors now.

MPEG-players are running much faster when running at 36 Mhz (of course the 50 Mhz
DSP does something too).

Keep Cool and Flying...

Hi

I thought about introducing ICONIFY into some of my programs.
Unfortunately I have very little documentation on the topic. A few
questions :
The iconified window shows a little icon. Is it the AESs task to care for
this icon, or must the program handle the redraws etc. for the small
window with the icon ? If the AES cares for it : How do I tell the AES
the actual ICON to use ?
To uniconify I use the wind_set (... WF_UNICONIY ...) call. Do I have to
supply the size values that came with the WM_UNICONIFY message ? Or is it
automatically restored to the original size and position ?
How does ALLICONIFY work ?

Thanks for any info, as I don't own the MTOS programming docs.

Cheers Peter

A new version of EXTRA is well on its way. There will be several new commands and of course the usual improvements. The fee is yet to be decided. If you can't wait then write to Top Byte (address in most Atari ST publications) and demand it gets sorted out NOW!

Owners of the existing EXTRA 3.00 will be given the option to upgrade to version 3.10 when it is released. Again, the fee has not yet been decided.

One of the commands to go is lextra. I am sorry because I am sure so many of you used it to its capacity but it had to go to make way for other commands ;)

Thanks you to all those registered users who completed the questionnaire. The feedback has been taken on board and is appreciated.

Martin Cubitt, author EXTRA extension.

You are responsible for drawing the contents of an iconified window. You just get WM_REDRAW messages...

> To uniconify I use the wind_set (... WF_UNICONIY ...) call. Do I have to
> supply the size values that came with the WM_UNICONIFY message ? Or is it
> automatically restored to the original size and position ?

I think you have to pass the values you get from the WM_UNICONIFY message into the WF_UNICONIFY command. The AES remembers the uniconified size & position of the window for you at any rate.

ALL_ICONIFY is a pig because you are responsible for remembering all your window positions before you close them.

This is sort of explained in the Compendium, although not very well.

Hi

  Any STOS programmer here?, well there must be, it seems STOS was voted best programming launguage in the Annual ST Format awards,

  Well now we have our own page, for the latest STOS.FAQ the most extensive S.EXTension list (that includes downloading and reading doc files or mailing the authors), all the information about what articles have appeared in 25 issues of STOSSER Diskzine, a list of all the files given away in that diskzine, Download STOSSER,
  Articles and info abound, aprox half a meg of text for you to read, major update in January with a couple of hundred thousand more bytes of STOS text for you, check it out NOW!

Works with CAB in low or Medium rez, best in med!

http://www.airtime.co.uk/users/stosser/

Please give me some feedback!

Please, don't do that. This would be considered dirty programming because
you gotta write the current-process variable, which is documented
as read-only. On later TOS versions (certainly on mtask versions) the
program may very well crash.

> Oh, welks.
>
No, you misunderstood. It can be done by utilizing the AC_CLOSE message.

But there were rumors that occasionally this doesn't work properly.
However, it worked fine when i tried this.
After receiving the AC_CLOSE message by evnt_multi() you _must not_ call
any further AES function before you've freed _all_ memory that has been
allocated after bootup time. The reason that you must free that memory
I've explained earlier. You must do it _before_ the next AES call because any
AES call may do a taskswitch, completing the main application shutdown.
That shutdown would release all that memory, and from that point you may
neither access the memory (of course) nor free it ('cos it's already
freed and TOS is programmed badly enough that it cannot cope with free
memory chunks that are freed again).
The thing is dangerous anyway, 'cos you gotta expect bugs in single-TOS
everywhere (the rumors I mentioned above probably got to do with that).
So it's certainly safer to do without these things.

Cheers Peter

Not long ago I posted an article asking why my Falcon program could change
resolution and back to normal ok without blowup, but the screen is messed up
when you get back to the desktop with blowup turned on.

Aparently this was a bug with blowup and have since installed an upgrade which
was supposed to fix this - but alas no.

I there anything you need to save apart from the modecode before chnging
resolution ?

Would I be better off saving the size of the screen using Vgetsize()
and returning to normal memory using that ?

Thanks,
Phil.

Hi there !

Could somebody give me a hint what libraries I could use with
GNU C on my AtariST ?
I wanted to do some graphic-stuff - FAST graphic-stuff to be more
precise ;)

thanx in advance,
Andreas

True, but it doesn't work either (but *is* needed) under "normal"
single-tasking TOS if MiNT is active... :-(

>routine?

Most Atari C compilers preserve D2-D7/A2-A7 across function
calls; unfortunately, Pure C 1.0 uses D0-D2/A0-A1 for passing
parameters and thus *does not* save D2 - which may cause
problems if a program that *wasn't* compiled with Pure C 1.0
calls a function that *was*...

Examples of this: GEM AES (when it calls USERDEF functions) or
the Minix FS driver (when it calls MiNT kernel functions through
the kerinfo struct); the latter only is problematic if MiNT was
compiled using Pure C 1.0 and the FS driver wasn't...
(And you simply *can't* compile the current Minix FS driver with
Pure C since it uses some GNU C extensions.)

You might have noticed the Pure C version number: this problem
was sovled in Pure C 1.1 - functions using `cdecl' (stack)
parameter passing now save register D2, too!
(This is not documented (AFAIK), but verifyably true...)

Note that all this only applies to *direct* function calls -
calls using a TRAP interface don't have these problems, since
the upper level of the trap handler is always written in
assembler and does all the necessary register saving anyway!

> I know that Pure C has a compiler option `no register
>optimisation' which, when turned on, will make sure the contents of
>all registers will be reloaded before any use. But this will
>definately make things slower...

That won't change very much - the register variables (D3-D7/A2-
A6) are automatically saved anyway; there are only two valid
reasons for turning off register optimization: firstly, the Pure
Debugger doesn't handle re-allocation of register variables too

well, and second, the optimizer still has a small bug -
sometimes (rarely) the register allocation scheme will go wrong
in very complex expressions...

>About the stack vs. register passing of arguments in Pure C (as
>mentioned in Eric Smith's reply), I thought the FreeMiNT sourcecode
>has been made with ingenious IFDEFs and such, so that when Pure C is
>detected, all functions will have the `cdecl' switch.

They should, but I'm not sure how extensively this was verified
and tested...
(BTW: you only need `cdecl' parameter passing for functions
callable from the "outside" - purely internal functions can
continue to use register parameter passing, possibly gaining
some speed!)

Martin

Hm, wait a moment... I have a Falcon and Pure C. And a big problem: The
editor is absolutely incredible slow when the code gets big (well, not real
big, lets say bigger than 100 lines or so...:-( )
I don't know why, but I'm just looking for some other solutions. Maybe I
could just use another editor with the compiler and linker of Pure C, but
I have to try it i.e. to get a good, fast editor first.

Just idle curiosity here. If there's no reasonable way of dynamically allocating accessory memory then what about doing it via a TSR?

You have to generate a .sym file too. You have to use sym-linker for it.
You'd rather look to tex documentation of gcc and gdb...

regards,

Simon.

newsgroups: comp.sys.atari.programmer
summary: How do you detect the screen size without the VDI?

I am in need of finding the screen dimensions, number of bitplanes etc for the screen, however, without using the VDI...

This question could probable be read: How does the VDI figure out the screen size/number of bitplanes etc.. given the fact that there are such things as 17" SVGA monitors, Screenblaster hardware, virtual screens, and reflex/supernova graphics card (etc, etc, etc..)

Cheers,

James Cox <jamesco@cogs.susx.ac.uk>

I must correct myself here - I just happened to notice the following
line in the MiNT documentation (Appendix E):

>(for example, Alcyon C preserves only registers d3-d7 and a3-a7)

Apparently Alcyon C saves even fewer registers than Pure C; since
Alcyon C was used to compile the GEM AES, USERDEFs compiled with
Pure C 1.0 shouldn't cause any problems...
(However, the MiNT/MinixFS problem is real!)

Martin

According to the Compendium :
     global[1] is the maximum number of concurrent apps supported.

MonoTOS ("SingleTOS"? "UniTOS"?) returns 1 in this element of the array.

MultiTOS returns -1 (meaning "unlimited")

In the tuwtcp package there is a GEM-based telnet/ftp-client with sources and everything. Is it possible to compile this to work with STiK?

Hi. Does anyone have any specs on programming the Local Talk ports on Falcons,
TT's and Mega E's? I'm trying to make an Ethernet card that turns the local
talk port into a Ten Base T port and does ethernet to Net with PC's.

(It'd also be nice not to lose my Modem port in the process although rumor has it that that isn't possible.) I'm programming on a Falcon, so currently Falcon specific specs would be fine.

For MagiC 2, read this in addition to the usual shel_write() stuff...

shel_write(flag,graphic,gem,command,tail)

```
short    flag,graphic,gem;
char *command,*tail;
```

NAME	VALUE	SYSTEM
SHW_IMMED	0	PC-GEM 2.x
SHW_CHAIN	1	TOS
SHW_DOS	2	PC-GEM 2.x
SHW_PARALLEL	100	MagiC
SHW_SINGLE	101	MagiC

SHW_PARALLEL

Start new process in parallel. Returns application id of the new propgram; when this terminates the "parent" receives the CH_EXIT message. 'gem' non zero denotes a GEM application whereas zero denotes a TOS application (which will get run in a window).

CH_EXIT

Sent to parent process when child (started via shel_write()) has terminated. msg[3] contains the application id of the child, as returned by the shel_write() which invoked the child, and msg[4] the child process exit code.

Doesn't your canon do epson emulation? If it does, then assuming Word
Writer has an epson driver, you should be able to print your novel.

(This question is relevant to MagiC 3 as well as MagiCMac, I suspect).

I am having difficulty finding a Pexec mode supported by MagiCMac that
does what I want. Under MultiTOS, I would use Pexec(100, ...), but
this seems to be unsupported under MM :-(

All I want to do is start a TOS program from another, but without the
parent blocking until the child completes. Under MultiTOS, this should
be something like

```
   Pexec(100,...);
   do_something();
   Pwait();          // Wait for child to exit
```

On the falcon, both serial ports are 8530 based. There are several manufacturers
of this chip, so obtaining a users manual shouldn't be a problem.

If you want to see example code, download sources for linux-68k. You can find
an SCC (8530) driver in drivers/char/atari_SCC.{c,h}.

By the way--I do not believe the Falcon has DMA for the SCC, thus achieving
a decent baud rate will be a problem :(.

>(It'd also be nice not to lose my Modem port in the process although rumor has

I'm not sure which modem port you're refering to. I have a Falcon. If you're
talking about it's RS232 port--no problem. Both ports can be in use at the same
time.

AIUI, the Canons emulate Epson 850LQ or IBM Proprinter X(L)24E. There
really is no such thing as a "Canon
driver".

It's best to pick the Epson emulation as the drivers are more
common.

r > ...between the existing lines (the "1" is incremented each
r > time).  This time the program ran fine!
```

Usually, when a program runs fine in the interpreter, but crashes when compiled, it is due to one of a number of memory handling problems.

First, you may be RESERVE'ing less memory than your program requires. In which case the program will crash when your program goes beyond its defined memory limits. Try increasing the amount of memory you RESERVE at the start of the program, and remember to RESERVE memory only ONCE at the start of the program, and then release it when you exit the program.

Second, you may need to force a garbage collection. Try replacing the PRINT "1"/PAUSE 50 lines with a ~FRE(0) and see if it solves your problem. GFA doesn't always clean up after itself very well, and you have to do it manually sometimes. I usually put the ~FRE(0) command in my programs event loops.

Third, you may be using up too much of the free memory, and not leaving enough for the OS.

```
r > max%=MALLOC(-1)   !  find out how much free memory is available
r > IF max%>1000000
r >   max%=1000000     !   to keep from claiming too much memory
r > ENDIF

r > s%=MALLOC(max%)
```

In the example you gave, there is no allowance made for the OS. If you have exactly 1000000 bytes free, you are using it all. Try allocating this way to save 64K for the OS to use:

```
max%=MALLOC(-1)-64536
.... Insert your error messages here ....
s%=MALLOC(max%)
```

Good luck!

Anthony Watson

There's no reason at all to do it yourself - you can always use the VDI
functions to determine screen size, colour depth, etc...

Why do you want to do it without the VDI? The only reason I could think
is that you want to do it from an Auto program, and that's not really a
reason at all (you just have to remember to open a physical workstation
to the screen, and close it again when you're through if you want to have
GEM start after your program exits).

Craig.

We asked id Software in our letter what they thought about the project,
but they've not replied. We'll try normal mail as well.
In the current state there is of course nothing id could complain about.
So far BAD MOOD is not much more than a glorified WAD viewer. Similar
FreeWare and ShareWare programs have long been available for the PC.

>if, however, its totally freeware, then you should be ok, but don't
>say I didn't warn you. =]

BAD MOOD is, and always will be, totally free.
We're well aware of the potential problems, though, which is why we've
tried to get some kind of official statement from id.

MagiC returns something like 10 or 16. The test for multitasking TOSes should clearly be 'AESglobal[1] != 1'.

I have a program, compiled with gcc, that crashes after receiving SIGCHLD. I ran dbg on it and it clearly said: "Program stopped with signal 20 (Child Process Exited)". As far as I know, it isn't normal for a program to crash after receiving SIGCHLD, the default is: no action. The program crashes both under MiNT and under normal TOS.

It doesn't matter if I execute the child process with Pexec (mode 0) or the standard lib function system().

Any ideas what could cause this behaviour? And what can be done about it?

The same program compiled with PureC executes flawlessly.

reply-to: robaries@aol.com (Rob Aries)
newsgroups: comp.sys.atari.programmer

I have a few questions regarding compiling GFA 3.5 programs. I'm having a problem and can't figure out why. My compiled program bombs (2) after my welcome alert. In a crude attempt at trying to find which line of code was at fault, I inserted lines like...

```
PRINT "1"
PAUSE 50
```

...between the existing lines (the "1" is incremented each time). This time the program ran fine! I then started commenting out these lines, one set at a time, and re-compiling. Sure enough the program bombed after all but the first set of these extra lines were commented out. I'm at a loss as to why the inclusion of these lines would make the difference between my program bombing or not. Here's some of the code:

```
[......]
max%=MALLOC(-1)   !  find out how much free memory is available
IF max%>1000000
  max%=1000000     !   to keep from claiming too much memory
ENDIF
ALERT 0, [etc... my welcome alert]
PRINT "1"
PAUSE 50
s%=MALLOC(max%)
PRINT "2"
PAUSE 50
IF s%=0
  ALERT 1,"Couldn't allocate memory.",1," OK ",blah%
  END
ENDIF
```

```
DEFFN done=(MOUSEK) OR (too.much!) OR (INP?(2))
PRINT "3"
PAUSE 50
DEFFN file.ok=filename$<>"" AND RIGHT$(filename$)<>"\"
PRINT "4"
PAUSE 50
[....]
```

As I said, the program seems to run fine with all these lines enabled. I start commenting out the PRINT...PAUSE lines, starting with the higher numbered ones and working back, and re-compiling each time. When I comment out all but the PRINT "1"...PAUSE 50 and PRINT "2"...PAUSE 50 pair, I'm back to bombsville (after I click on the "OK" button of my welcome alert, the numbers "1", then "2" appear on the screen, then I get two bombs and I'm back to the desktop).

A few things: I'm running TOS 2.06 on a 520st expanded to 2.5 megs. I'm using MENU.PRG (with its default settings) to compile with; the return codes from both the compiler & linker are 0 (good). I've tried booting the ST with no accs or auto progs (except ICDBOOT). Nothing has worked! Any help, or clues as to how to look for the cause of this, is appreciated! TIA,

Rob Aries

>
No way. VDI is told by the screen driver how large the screen is. You seem to worry about functioning with foreign hardware, so you have to solve the problem properly. There is only one single way and that goes via VDI : Open a workstation and the screen resolution and number of bitplanes etc. is written into the intout array. Then you can close it again. But there is no proper way without VDI.

Cheers Peter

X-Deja-AN: 120926791

organization: Ruhr-Universitaet Bochum, Rechenzentrum
newsgroups: comp.sys.atari.programmer

Hello all !

As many people, I have some problems with Stik. But not the same like other people here. The problem only occur, if I want to use CAB. IRC works fine.
I have checked the posting in the Usenet, but their problems (setting of the Cache-directory, uncompressed SLIP) doesn't fit here.
First I describe the problem that occurs:
If I try to load some pages, CAB stops reading the data of the page or an inline-graphic after around 1600-1700 bytes. Then after a while CAB continues to load the next document (seems to be a time-out). The error occurs always with the same document or graphic. So a document does always work or doesn't work always. IRC works fine.
Second I describe my system:
I have a 520STM, 2,5 MB, HD, 38400 Baud. Software is Overscan, NVDI3, and HSMODEM6. But the error is the same even with only Stik and HSMODEM. I'm using the www08.zip archive. The next is a part from my default.cfg:

```
TTL         =   64
PING_TTL    =  255
MTU         =  576
MSS         =  536
PKT_SIZE    = 2048
DFB_SIZE    = 2048
RCV_WND     = 2048
```

My Atari is directly connected to our server, a 486DX100 with Linux, over a uncompressed SLIP-connection. Connection over a terminal works fine.
Third I describe our trys to resolve the problem.
I have talked with our system-administrator about this problem and we have checked the packages, which are sent between the computers, and tried different settings of the default.cfg. We have found the following:
The server sends packages with the size of 536 and the atari sends packages, that he have get them. The window-size decreases every time. After around 1600-1700 bytes, there is only a small window-size left (e.g. 191 bytes).
The server then sends a package with this smaller value, but the Atari doesn't respond to this. Then the server sends this package every few seconds again, but the Atari never sends a message, that he have get them.
We have tried other values of MTU, but no changes.
We have tried other values for RCV_WND, but the window-size the Atari sends to the server is always 2000 !
Our Administrator told me, that there have been the same error in the first Linux-versions and he have corrected this (he is one of the developers for Linux).
Does other people have seen this error, too ? Or does somebody knows, what to do ?

Bye, MarkusS.

Recently, I was playing around with the desktop.inf file, seeing what all the stuff does, and Something Is Not Right now. What happens is when I come out of a program, or even from the text viewer, an extra window appears on the desktop! It's a normal window, but the window that was previously open shrinks to the smallest it can get! Another thing about it is, that when this window appears, I not sure how to describe this, but there's a flash of color diagonally down from the corners of the window, almost like there was a window closing just before I come out of whatever I was in- get it? Clear as mud, no doubt.

Anybody have any ideas on how to fix this? I'm not sure how this happened, because I made sure the file was back the way it originally was, but it's still Messed Up. Perhaps someone could send me their desktop.inf file so's I could see if I maybe didn't get it back quite right or something? Any help would be greatly appreciated.

Cheers- Peter Keller

Are we just talking Falcon here, or does it have to be ST compatible (for Novas etc)?

If its just Falcon, then I can help a bit... Take a look at the hardware register listing - contained there is a lot of stuff about the horizontal / vertical border / screen size.

To calculate the height, its (vertical_screen_end - vertical_screen_begin)/2 (its measured in half lines), *2 if Interlace is set, /2 if double line is set.

Width, I cannot remember off the top of my head, but its all there...

Bitplanes: This is the tricky one - The hardware register listing gives an address which has 2/256/65536 colour mode flags, but not 4/16. I have been told by a number of people that this can be found by examining the ST Shifter address... I still haven't yet got around to sticking this code in, so I dont know this for certain...

Hope this helps... mail if you need more specific info...

Anthony

I wonder what an application should do if (global[1] == 0).
A `stop #0x2700' instruction, perhaps? :-)

I own an Atari Falcon 030 which I use as a hard disk recorder (with Cubase Audio), as part of a multimedia studio. Recently I have been given access to a pair of Seagate Barracuda 2.5 gig HDs. They are beautiful drives but the obsolete Atari "TOS" OS insists on limiting partition size to 256 megs and refuses to accept more than a gig per SCSI id number. These are ridiculous limitations on an otherwise fantastic system; it would be great if my computer also had full access to these drives!

I have heard that Linux has been ported to Atari. Can anyone explain what the implications are for a Falcon platform? Essentially, I am looking for the ability to create large (multi-gig) partitions; my system must function with 16 megs of RAM, so turning the Falcon into a Mac would probably be out of the question ;)

If anyone could help get me out of the Stone Age, I would really appreciate it! If you prefer to reply via E-mail, you can reach me at agreenwe@castle.uvic.ca

Thanks, Anand

I think they are on the Line-A _variables_ (it's functions that aren't
supported by new OSs). I'm not sure about how to access them (SozobonX
C doesn't support it, but GCC has at least a linea.h header file...).

Just install a better hard disk driver. HD Driver (a commercial product)
allows much bigger partitions, and works faster as well.

> I have heard that Linux has been ported to Atari. Can anyone explain what

Yes you can have big partitions under Linux as well. I have a Conner disk
without several large partitions and one gigabyte or so partition. No problem.

i tried to install gnu c++ (version 2.5.8) on my standard falcon (4MB ram)
and have some problems.

1. i use towsin14(?), tcsh (from tcsh.zoo) and vi (elvis17.zoo)
   when i start vi in the tcsh then i cannot move the cursor with the
   cursorkeys. Does anybody know why this doesn't work?

2. after the installation of gnu c++ i wrote a test programm hello.cc with
   one includefile and one output line. when i try to compile this i will
   get a message similar to this: "virtual memory exhausted".
   after starting MiNT, TOSWIN and tcsh i have around 2MB of ram left. Is
   that not enough or is there an error in my installation?

if it's not possible to use gnu c++, is there another c++ available for
the falcon?

please answer also with email, because i cannot always get this newsgroup.

thanks in advance

Patrick

If you want to be compatible, the best way to go is to use VDI... However, you could write a routine for ST, one for Falcon, one for TT etc. and then stick a little machine detector code at the beginning, which selects the correct one...

To be honest, I dont know, as I dont have Screenblaster, or any other hardware video-upgrades. It does work with FalconScreen, the software enhancer, and probably with all other software ones, but I dont know whether it works with hardware... Anyone?

(James: do you have screen-blaster? If so, then I could send you my code, and find out...)

Anthony

organization: Pacifier, public access Internet site. 360-693-0325
newsgroups: comp.sys.atari.programmer

Hello,

I am looking for info on programming the Modem 2 and Serial2 ports on the MegaSTE. I already have the Atari Compendium, as well as the Atari Developer docs, but neither of these explains "HOW" to program these ports.

Specifically, I need to know how to set the Baud Rate (i.e. 57600 or 115200 baud), how to select which port I want (Modem, Modem 2, Serial 2), and how to send and receive data from those ports.

An example in BASIC or Assembly would be appreciated, though it doesn't need to be very extensive. Just a simple sample showing how to select the port, set the baud rate, and send/receive a byte to/from the port.

If you can help, Thanks!

Switch your computer on with no disk inserted, After a while it will come up with the Desktop. Then Insert a Disc and Save Desktop to produce a standard DESKTOP.INF file for you to look at.

I have a TT with 4 meg of memory, a 19 inch monitor that I would love to sell before christmas. It has been sitting lonely for the last several months waiting for someone to use it. No one does. This system is going cheap. If you are interested, leave e-mail to tthompso@pcshs.com.

I have alot of software to send if you are willing to pay the freight. (ie. Pure C. many terminal programs and a list will be made for the buyer of the system.)

I also have an old ST 520 1meg machine, with mono monitor.

leave e-mail to

Can anyone recomend a good C++ compiler for the STE. I need one tonight
because a my programming project needs a lot of final work, and its due
in tomorrow (Friday)! I will need an ftp site where to get it, if known.

I've tried GNU g++, but it only works on systems with hard drives.

Sorry about cross posting but this is urgent!! :-(

Cheers,

Fraser

You still lose, as you don't cater for any graphics cards.

Hi,

  some time ago I heared something about a source code library which
emulates gem calls in an X11 environment. Are there any news on this
project and where might I find some hints?

     Wolfgang

newsgroups: comp.sys.atari.programmer

Hi,

  some time ago I heared something about a source code library which
emulates gem calls in an X11 environment. Are there any news on this
project and where might I find some hints?

Wolfgang

summary: Atari ST H/Software for sale

Updated: 12/6/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
I can not keep up with the newsgroups, so please use one of the below
ways of contacting me.
You can contact me at:
BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com

WWW: http://www.lm.com/~asmodeus/
there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on an idividual basis per order. All prices are in US Dollars, and payment is to be in US Funds. Money Order payments will be shipped the day after I receive payment, and personal checks payments will be shipped when the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.
COMPUTERS:
1040 ST/F 1meg memory $130.00
1040 STE 4megs mem. $300.00

MONITORS:
Color Monitors atari brands $100.00
Color Monitors atari brands $100.00
(P) Color Monitors(broken, power box) $25.00
SM124 Mono Monitor $75.00

STORAGE DEVICES: (Hard drives and Floppy)
Indus GT External 720k Floppy $70.00
Toadfile 130meg + 80meg HD w/ICD+ host $250.00
ShoeBox 80meg HD w/ICD+ host $120.00
20meg shoebox, atari adapter $90.00

OTHER HARD WARE:
WICO Bat-handle joystick (9-pin) $10.00
(SOLD)Epyx The Grip joystick (9-pin) ******
The BEst TrackBall $20.00
The Cordless Mouse (Practical Solutions)$30.00
Mouse Master $20.00

VIDEO:
Video Key $30.00
ST Video Digitizer $15.00
The Complete Colour Solution (Sold ONLY as a set)
(Vidi-ST, Vidi-RGB and VidiChrome ST) $90.00

AUDIO:
Stereo Replay audio digitizer $85.00
ST Sound Digitizer (Hippopotamaus) $25.00

PARTS:
2 assorted Atari internal floppy drives for parts $8.00
1040 case and rf shield $10.00
4 Atari 256k Simms from Ste (Make Offer) $35.00

ATARI SOFTWARE FOR SALE

>
I was afraid of this ;-) Lets take my maschine for an example. Currently
I use a screen resolution of 960 x 544 with original on-board hardware of
an old 520 ST+. This is possible by uprating the board clock to 12 MHz
and giving to the ST video hardware new Vsync and Hsync signals. I can
even use my old SM 124 for this resolution (indeed, it does it !). This is
very cheap (cost me less than 30 bucks) for considerably increased screen
resolution, therefore I think that quite a few STs have been upgraded
this way. For any software looking to the hardware register this computer
looks precisely the same as with the original 640 x 400 resolution. You'd
have to do careful timing measurements to see the difference. I only need

a tiny driver that allocates screen memory, sets the video base adress, and writes according numbers to the LINEA Variables when AES calls the open_workstation VDI function. Thats all, no resident driver code.

I'm absolutely sure that any software that doesn't use VDI and tries to figure out the screen resolution on my maschine will fail, unless it is carefully trimmed to my kind of hardware (which would require quite some afford).

I'll will go even further soon. I got some 19 inch computer monitors and I'm about to build a graphics card for them (1024 x 864) that will need even less software aid, and will still look like original 640 x 400 when looked at the hardware registers.

So there is no way to fulfil your promise :
> I am really after making a general purpose system that would work with
> all Atari's, ...
unless you use VDI !

Hope that clarified things Peter

AFAIK, g++ is the only C++ compiler ever ported to the ST.

I have a Canon BJ200 as well, and I've made some changes with the dip
switses, so I can (and does) use a printer driver called EPSON 850..
Check your manual for a complete list of compatiable epson printer drivers..

Hope this helps..

Greets Jakob :)

I don't think any C++ packages are avaiable that will work with floppy-only
systems. They're simply too big.

AFAIK the blitter in the Falcon cannot be turned off, BUT NVDI has a switch (set in the CPX) that allows it to avoid using the blitter for any routine it supplies that would use it. However, it cannot prevent other programs from using the blitter it they bypass NVDI by using the blitter directly.

Hello there, (AAAARRGGHH this is the 20th time I'm writing
this...serverproblems...8{

I want to program on a SM144 and run the program on a TV.
I just can't stand the interlaced mode on the TV.
I've got a Falcon with Screenblaster 3 inside (which won't install itself
on the SM144).
I tried to access the Videl registers but the SM144 stays 'on-line'
can anybody help?
greetings, Arco (Goof of the Giants)

Nice!

Could you supply details of the hardware modifications.

Last week I tried to reduce the entropy in my room by rearranging some old
magazines
that were lying around on the floor. I had a quick look into some of them and
there
was an interesting article from 1991 about Objective-C for the Atari. It wasn't a
stand alone compiler but more kind of a preprocessor which translates Objective-C
into 'normal' C to be compiled using a C compiler. I haven't heard of this anymore
so I believe it's not available either ...

I would have thought that it would work, as it is quite easy to test the
line_a variables. As its not a Falcon, checking the video register is
not much use for screen-size detection if you want it to work with enhanced
modes...

> So there is no way to fulfil your promise :
> > I am really after making a general purpose system that would work with

True - If you want to be 100% compatible with all the possible different
modes you should go with the VDI...

I dont know if they do, but shouldn't graphics cards put a cookie in the
jar to make it easy to detect what resolution it is???

Anthony

hi there,
my name is elad, and i know nothing about Atari (except the TV-game...).

I have a musician friend who works with ATARI 1024, and uses a
proffessional MIDI application (called CILAB).

I own a pc computer, and want to transfer midi files from my friend, but
my drive won't accept an Atari formatted disk (3.5").

Is there a way to transfer the disk to DOS ??
Can my friend save his files on the ATARI at a format that will be
acceptable by my pc ??

your answer would be most apperciated, especially if you send it directly
to e-mail: elod@math.tau.ac.il.
Thanks !!!

 If I remember correctly, its a file missing, such as rsc or inf, or it
is also caused if the actual program you are running is incomplete,
 Lets say you unzip a prg, you run that prg, if it was incomplete then

you would get error 35,

I would say you have something missing,

Cheers.....!ynoT

2 MB might be a little tight for GNU C. Try to run TCSH without the
TOSWIN or even use a smaller shell (tcsh is rather larger).

> if it's not possible to use gnu c++, is there another c++ available for

> the falcon?

I have a system that I would like to sell, preferably as a whole, but I
will break it up if necessary. I have:

Atari 1040ST, 1 meg, mouse
Atari SC1224 color monitor with stand
Atari SX212 1200bps modem (blazing speed, eh?)
Atari SF354 single-sided external floppy drive
Gemini 8-pin dot matrix printer
All necessary cables and adapters

Everything is working 100% and in the original boxes. Make me an offer:
this thing is gathering dust in my closet, and I want to get rid of it.
Payment and shipping arrangements will be made when we make a deal.

If you reply to chris@flowerslabs.com, you'll get a slightly faster
response than from cjg48647@pegasus.cc.ucf.edu.

Traversing a simple linked list would get too slow. Also you need to store information for characters, not words. Many word processors embed this information in with the text and remember the current attributes and select them as "the internal cursor" comes across them. This is just one approach out of many.

For output, you want to be looking at ways that can output strings. Building a string output routine from a lower level character output routine will be too slow. If the mouse is involved it will also have to be turned off and on for each character which is bad news.

You want some method where you can look through the text to be output and build strings posessing the same attributes.

Using uppercase to represent bold ...

hello World.

You output "hello " as one string, change attributes to bold, output "W" as the second, change back to normal then output "orld." The same holds true for font changes.

I suggest you play with v_gtext() and its relations to get the feel of it.

The file you are trying to execute is not executable. It's simply a non-executable file with an executable extension, ie TOS/TTP/GTP/PRG/APP.

Is it possible to get the MyDials C Libraries compiled for Lattice C 5. It can't be that difficult to do even the custom Pure C functions they use could be emulated. Jon Ellis (jonellis@cix.compulink.co.uk) who edited the English version of the Interface Manual for Compo has offered to do it for FREE!. Surely if he signed a Non Disclosure Agreement and did it could only help everybody all round.

As it is I can read all about these interesting looking routines but not use them.

Does No| Software have an E-Mail address?

Matthew

I would like to make the lattice C compiler and linker resident for a program of mine that produces and compiles some code. Can anyone tell me how to do it? It is irritating for it to spend most of it's time loading the compiler!

I would also like to know how to discard the compiler and how to write my code so that it can be made resident.

Thanks

Tim

Hello !

well, here's my problem:

I want to link two ST with a Midi local network...
but, there's a probleme with my application : the buffer
gestion is to slow (about 2400 bps instead of 31000..)

So y want to use the Midi-Com accessorie to boost the
link... The application Mc-Talk4 use it, y want to
use it in the same way ..

So if you can help me, please write an E@mail ...

Thanx.. and sorry for bad english (8/20 for my exams -(( )

As standard there are 3 targets for GNU C, gcc itself, g++ (the C++
compiler) and objective-C. Making them all is the default action for
the makefile that comes with GNU C.

I'm not sure if the a.a.u.e version of GCC makes in the same way (from
source), but if I remmeber correctly, if you're using MiNT/Linux the
standard C source compiles without too many problems.

ATB,
    Simon.

   Do you perhaps mean -35? The latter raises signal ENHNDL (Handle pool exhausted), which means there are too many open files.

There is a GEM shell for GNU C (available on a.a.u.u or ftp.cnam.fr) and

then you're able to run any of your favourite GEM text editors.

For GNU C I always use virtual RAM (eg. V-RAM - shareware or Outside - commercial) on my 4Meg falcon.

> if it's not possible to use gnu c++, is there another c++ available for

No, it's only one...

But I still belive that it's possible to run pure GEM without BLiTTER, look - eg. it's possible with the Outside virtual memory because it doesn't use BLiTTER at all. Do you think the Outside has it's own

blitting routines?

> P.S. Do you have any information regarding the accelerator made in Poland? I
> saw some of your postings to the linux-m68k mailing list regarding it...

So that's why I want to keep BLiTTER off. I'm writing the software for
the SpeedUp accelerator and there is a problem with BLiTTER at 50MHz
mode. On most of falcons is enough to put BLiTTER to half speed, but
there are some which didn't like to go at 25MHz (BUS speed) at all (even at
12.5MHz). And I guess I haven't to write my own blitting routines :(

However the SpeedUp will be officialy available on February '96. I have
one in my falconfor two months an it works very good (especially at 50MHz
with your old internal CPU you have over 200% of pure falcon and over
130% of TT with TT-RAM!)

best regards,

Simon.

I don't think a linked list for words would be smart, for two reasons:
First, you'd have quite a memory overhead, and second you won't be
able to change fonts _inside_ a word, which is not al that esoteric,
e.g. when using super- or subscripts.

I'm currently writing a Speedo wordprocessor; I haven't implemented
font and style changes yet, but intend to use a code at the place of
change. To speed things up, I have a special code to signal text
lines with no font stuff in them (after all, probably the majority of
the text) which thus do not have to be parsed and can be fed to f_gtext()
directly. But as you see, the hard work remains to be done yet.

To keep memory usage as tight as possible, I allocate textblocks when needed (currently every paragraph occupies such a block), but I already foresee trouble importing a large, `paragraphless' ASCII text.

The textblocks form a linked list, however.

But this stuff is giving me headaches anyway... :-) A wordprocessor dealing with proportional fonts is about an order of magnitude more difficult to whip up than a simple fixed-width one. (Just the cursor positioning took me hours and hours...)

Good luck! (And expect to see my WP somewhere in 2010...)

I'll try to dig them out. I did these things about three years ago. Meanwhile I noticed that not all SM124 can cope with a 48 MHz pixel rate. But a rule of thumb is : The older the better. So if you have a really old SM124 you might be lucky. Modern multiscan screens should do it anyway.
I remember me buying a new CPU (a 16 MHz version of MC 68000), four 74ALSsomething to speed up the CPU bus drivers, a couple of resistor arrays for proper bus termination. These things didn't speed up the system, but made the board cope with 12 MHz. The system clock is derived from the video clock (32 MHz originally), so it had to be replaced by an 48 MHz oscillator. There are two things that complicated all a bit :
The floppy disk controller still needs 8 MHz, unless one wants to create his very personal disk format not readable on any other computer; and new video syncs are required because originally they are not derived from the video clock, I think.
The latter problem is solved by a little EPROM sequencer (about 2x2 inch) that produces Vsync, Hsync, and DE (display enable) for two different screen resolutions : 640x400 during AUTO folder execution, then switched to 960x544 after bootup. This sequencer also incorporates the new board clock oscillator (48 MHz).
The floppy problem is solved by another little daughter board (1.5x4 inch) that features another oscillator and a new floppy chip. I used a new controller because this way I could introduce HD technology (1.44 MB floppies) into my system. The oscillator produces 16 MHz. This goes directly to the FD controller for HD operation, it is divided to 8 MHz for DD operation, to 2 MHz (for the sound chip, to correct for the pitch of the sound system) and to 500 Hz for the ACIAs (needed for proper baud rate for keyboard communications).
After all this is done the last thing to do is to adjust some pots inside the SM124, to make the picture fit onto the SM124 screen.

Now the whole computer is faster by a factor of 1.5. It starts with a small picture (640x400), then AUTO folder programs are executed (the screen driver is one of those), then the picture will blow up to 960x544 and the desktop appears.

This system is most compatible (any program that runs with any external graphics card would run on this maschine; I tried MiNT with X-Window as a really hard compatibility test - it works !!!) and reliable (well, I had to replace the video chip about two years ago, but I do not think that was connected to this speedup.

The idea was from a german magazine, I'll look for that article. If you're really interested, get a german dictionary ;-) and give me a fax number.

Cheers Peter

I have several folders on a 120 Mbyte minix partition that I cannot delete.
I have tried both the desktop delete & RMDIR (from a shell) with no change.

The error message I get is 'access denied' (-36).

These folders are not corrupt, as I can copy in & out files.

I remember the thread about undeletable files a few weeks ago & some of
the solutions involved editing disk sectors.

I cannot edit the hard disk, as I do not know enough about the Minix
format & besides I don't think any of my disk tools can handle it.

Am I missing something really obvious here, like permissions or user privileges?

Hmmm. I was under the impression that the Falcon TOS no longer has
VDI code that works without a blitter. That's why you have to have
NVDI to switch it off. (And it becomes faster, too... I don't really
like that. Try explaining that to your PC friends...: `But my Falcon
has an internal BLiTTER chip that speeds up the graphics - if you turn
it off.')

It could be that you don't have write permission for that directory
(permision to write = permission to delete).

Try `chmod 777 dirname', which sets all permissions on; you might also
have to do this to the directory which _contains_ the directories you

want to delete.

This is not true. GFA will not only work with Magic, but are running
perfectly even on my PowerMac/MagicMac setup. The Compiler needs to be
patched (*very* simple to do), and A La Card (Shareware, Reiner Rosin) is
needed to make the interpreter work with MagicMac, but it *does* work.

 s> Similar problems I have with
blitter.

You could try my boot manager for the Falcon, it's called Stoop. It's
shareware, but is useable with some features disabled - you won't be able
to change the cache (unless you register) but it should stay switched on if
it is already
set.

You can ftp it
from

archive-server@micros.hensa.ac.uk

and the file
is

micros/atari/falcon/a/a091/stp105be.zip

and it is 127kB
long.

Does this work with _all_ TOS versions and what are the problems with
the serial and TT mice?

Would the assumption that evnt_multi() will also benefit from this be
correct?

Really? So I guess that I must not be using GFA with Gemini and MagiC in
order to write multitasking compatible, modern user-interface programs, then?

What I think you mean is that the GFA editor or compiler won't run while
multitasking (and the compiler won't at all).

But GFA compiled programs, written properly do work under MagiC fine.

I _really_ like GFA, and have been using it for years, and find it very
fast. If you want to do forms, get a resource editor (Interface is best).

You didn't say what language you used, but under SpeedoGDOS
vqt_f_name returns additional parameter which indicates
whether the font is outline or bitmap. This call is,
if I understood correctly, vqt_f_name in C bindings, but
vqt_name in others (C basic).

Does anybody have some code for accessing the TT's SCSI-port, i.e. sending arbitrary command blocks to arbitrary devices? I know there is some sample code in the Profibuch (ugh... what a name...), but I am sort of loath typing the whole stuff in, particularly if someone else has done it before -- probably with some improvements in flexibility...

Hi!

I'm looking for source code (in C) for a form_do that allows for multitasking, that is it should not be blocking but polled.

Any ftp/www site ?

Kind regards

: At some point I thought I read something about a systemic way of
: restricting the mouse pointer movement to a smaller, specific rectangle.
: But now that I need to do this I cannot find any supporting documentation
: reference. Is there a systemic way to do this or does it have to be
: coded by hand?

What you do in theory is:
Put the limit size of the box in coordinates eg
XMIN
XMAX
YMIN
YMAX

then you get the coordinate of the mouse eg
X
Y

and then just say that:
if X is less than XMIN then make X=XMIN
if X is greater than XMAX then make X=XMAX
if Y is less than YMIN then make Y=YMIN
if Y is greater than YMAX then make Y=YMAX

that's the theory, and according to a hardware address document I've got...
the Words (2 Bytes) at $00241c and $00241e contain the X and Y mouse
positions respectively.

Hope this helps

:
: So which is best for making quick prototypes GFA or Hisoft Basic?

I have used both GFA BASIC 3.5 and HiSoft BASIC 2.1.

GFA BASIC works perfectly well, and is superior to HiSoft BASIC in some ways.

However, The GFA 3.5 interpeter is very badly done, it doesn't do anything in GEM windows, doesn't work in anything except ST low/med/high, does lots of horrible things that completely mess it up in a lot of situations other than a standard ST. I certainly don't recommend the interpreter. The compiler is ok, but you need the interpreter to generate the tokenised file for the compiler to read, so either way you can't escape from the interpreter.

I have heard of a newer GFA BASIC (3.6TT and 4?) but have not seen these myself. For this reason, some of my comments may be out of date.

Some excellent programmes have been written in GFA Basic, but for GEM programming HiSoft BASIC is IMHO much better. You get libraries for all VDI functions, not just half of them as in GFA BASIC. And the same for the AES.

You have a GEM friendly, easy to use editor, unlike the GFA BASIC editor. In addition, HiSoft BASIC is more compatible with BASICs on other platforms. If you are new to using GEM, HiSoft comes with a GEM toolbox, giving you pre-written functions for displaying Windows with Text, Images, Forms etc, as well as display of dialogue boxes and menus. The GEM Toolbox is, however, very buggy, but it may be a start. I ended up re-writing just about all of it myself.

In the end, both will probably suit what you want to do, but IMHO, HiSoft

BASIC will leave you with less problems. You won't go along withuot any trouble, then find that some vital AES function is not present. You won't be stuck in the (IMHO) hard to use, GEM unfriendly editor of GFA BASIC.

For writing a GEM friendly programme (like all programmes should be), I belive HiSoft BASIC to be in general a far better system to use, compared with GFA BASIC.

This is not to say that GFA Basic is hopeless, I have seen some perfectly good programmes written with GFA BASIC. All IMHO.

What is the necessary patch then? After the patch do the GFA commands work for menus etc or does one need to forget GFA and do the coding with an RSC. If the latter then to a large degree it defeats the purpose of using GFA.

I think it's clear that mailing a copy of a program to someone
who does not already own a copy is illegal in almost every country.
(In many countries it is both a civil *and* criminal violation.)
Not only is it illegal, but it's also unethical.

This is comp.sys.atari.programmer, so let's put it into a programmer's
perspective. If I wrote a useful program, I would definitely NOT want
Atari to distribute it without my permission. So, logically,
I should not distribute Atari software without their permission.

>granted that they are the same?

If a program replaces a TOS component, it must guarantee that it preserves
any registers that the TOS component preserves (in practice it may
preserve more). MiNT, for example, guarantees that d3-d7 and a3-a7 are
preserved across GEMDOS, BIOS, XBIOS, and MiNT calls, just as TOS
guarantees.

GEMDOS does not guarantee that d0-d2 and a0-a2 are preserved across calls.
However, many versions of TOS do preserve these registers, and some
poorly written programs rely on them being preserved. This may sometimes
be a source of problems with GEMDOS replacements and emulators.

>If not, this may be one of the
>reasons that my attempts in compiling MiNT with Pure C (famous for its
>register optimisations!) failed.

Your problems likely lie elsewhere. One possibility is a calling
convention conflict; MiNT's assembly language routines expect parameters
to be passed on the stack, but Pure C's default behaviour is to pass
parameters in registers.

Err....well.....lets say you didn't know. 8-)

The 0x prefix in c means hexidecimal.
So really 0x102 is.....258 decimal.
Just in case you didn't know the prefix 0 means octal and you can't do binary
in c source code - use hex.

Phil.

Take care because it does not always works with all TOS versions and
desk accessories.
I wrote a program (ObjectDesk) which use the right button heavily
and which is beta tested by 20 people.
I used this 0x103 trick and it didn't work for everyone!
It was stubborn with TOS 1.00, on some TTs and believe it or not, some Falcons.
I developed it on Falcon, but the mouseclicks behaved strangely on
other Falcons with the same executable.
At the end I included another kind of right button handling (with vex_butv),
which works 100% on all TOS versions including 1.00.

>>This allows you to detect both mouse buttons as well as double-clicks. For
>>triple clicks use 0x103.

I tried both of these out, but to no success.

Does 0x102 = Decimal 102 ? Or am I being particularly stoopid..?

Hi guys,

I am writing a program that also works as an accessory, and yet I am having problems.

Is there any special requirements for accessories (like memory limitations or whatever).

Basically, what it does: when the acc is loaded, the program runs and does some initialisation etc.

Then when the acc is called from the menu, it loads a resource (internally, not from disk) and sorts that out (apparently loading normal resources in accs is not good).

The thing is, it works fine. But if I try to run another program after the acc has been called, the computer always crashes. However, if I load the acc and don't call it, run another program, then call my acc, things behave fine from then on. I suspect it is some kind of memory allocation/fragmentation error - running a program eats into the space reserved for the accessory or something.

It doesn't misbehave under MagiC, either, so I hope it's not a TOS bug.

Anyone shed any light on this?

Hi,
     I'm trying to get back into programming GEM apps, and I thought
that I'd use the EGEM libraries, unfortunately I'm having difficulty in
compiling them using Lattice C 5.04. I've got a `Make' program, and I'm
trying to use the MAKEFILE.LCC... However, LC1 doesn't seem to like
the various .C files. I would appreciate any help, as my Atari C programming
is a bit rusty (Too long programming SmallTalk I guess!!)

thanks.

john..

Hello,

I am planning on buying a complete C package for the Atari Falcon030. The
question is, what C package should I go for?

I was thinking of PureC, but as far as I know the package is not
available in English, and as my German isn't very good... 8-)

I have heard that Lattice C is pretty good as well, but I have also heard
it's slow compiling and produces rather slow code.

I am going to use C for programming GEM. I would appreciate any
information and suggestions! Thank you!

A question concerning TurboAss.

I've done a assembly programming session in a ST with TurboAss from
SigmaSoft. This was quite some experience...

I've completely fallen in love with it, so here what I want to ask:

Is there an Amiga version of the TurboAss. I fear the worst, but I
just wanted to be sure and ask you if you know anything.
The Amiga assemblers are nothing compared to the powers of
TurboAss. Even if you'd combine all the good stuff of the available
Amiga assemblers, TurboAss would still be more powerful and user
friendly. I've never even seen a tokenizing assembler for the Amiga.

If anyone can help me (out of this uncertainty:-)
Thanks in advance,

No, no, no .... and no.

The prefix 0x... is the C way to denote hex numbers. Therefore 0x102 means decimal 258, and that's the number you've got to put in to make things work.

Search archie for 'nvdiguid'. Here's one place to find it:
ftp://micros.hensa.ac.uk/micros/atari/tos/p/p142/nvdiguid.lzh

It is in German, but I guess that won't be a problem for you ;-)

Go for it. The versions I've seen had english menues and dialogs, and -
if I remember right - the helps as well.
PureC is sold by Gribnif Software in the US - I cannot imagine a
US-company selling software in german.

XaAES runs as a user mode server program, and interfaces via pipes, so
this isn't an issue. If it's running a standard GEM program, the only
register that the trap re-director will corrupt is a0, but I will fix
that if it's problem.

Craig.

Yes, DA's are quite restricted in how they work. The biggest problem is that

they can't request any memory from TOS (ie you can't use Malloc).

Stuff Malloced by a DA can get taken away from the DA unless you are really careful; this is probably what's causing your crashes.

The basic work-around is to fool TOS into thinking the program making the Malloc is not you, but something else. You do that by fudging the current-process system variable just before you Malloc, and restore it as soon as Malloc returns.

I don't think MultiTOS requires this sort of bodge; anyway, there's no real need for DAs under multitasking OSes... Just ask Apple.

Basically there is a lot of problems with these things. There is no
reason (apart from having another file) to avoid loading resources by an
accessory. BUT : It MUST be done during startup time - that means boot
time, not call time ! This is because for loading the resource the
program doing that (here : the accessory) must allocate memory (actually
done by the AES call). The problem is that for GEMDOS any allocated
memory is owned by the main program. During bootup this is the accessory
itself, but at call time this is some other program that just happens to
run (can be the desktop, or any other real program). When that main
program is finished all owned memory is freed, also the memory allocated
by accessories during run-time of the main application. This leads to
crashes.

Conclusion is that any memory needed by an accessory should be allocated
at bootup time. Only exception is that the accessory handles the AC_CLOSE
message properly.

> The thing is, it works fine. But if I try to run another program after the acc
> has been called, the computer always crashes. However, if I load the acc and
>
Y'know, the accessory probably allocated memory that later has been freed
by GEMDOS due to finished main program, but the accessory probably still
accesses it. So does the newly run program, that allocated the SAME
memory and accesses it. -------> CRASH

> don't call it, run another program, then call my acc, things behave fine from
> then on. I suspect it is some kind of memory allocation/fragmentation error -
> running a program eats into the space reserved for the accessory or something.
>
> It doesn't misbehave under MagiC, either, so I hope it's not a TOS bug.
>
MagiC is free of this problem because it is real multitasking and thus
any memory is owned by the process (program) that allocated it.

I'd think so. The reason is : By using any register that is granted free by Atari the programmers of the mentioned packages would make the package incompatible with lots and lots of applications. Just that should be the main concern of those programmers.

At least MiNT and NVDI are pretty compatible with the things they are to replace (I don't know XaAES, thus no opinion), so I guess you can use the registers that are granted free by Atari.

> reasons that my attempts in compiling MiNT with Pure C (famous for its
> register optimisations!) failed. How can I force my compiler to use
> only a given set of registers, if at all?
>

Dunno. To get absolutely really really sure you can replace the library routines gemdos(), xbios(), bios(), aes(), and vdi() by selfwritten versions that save all registers and restores them - slows things down slightly but hard to notice I guess.

> Have I put my finger on the sore spot here or is this a problem that
> has long been solved?

All information IMHO. Make your own mind.

Cheers Peter

Hi,
     I'm trying to get back into programming GEM apps, and I thought
that I'd use the EGEM libraries, unfortunately I'm having difficulty in
compiling them using Lattice C 5.04. I've got a `Make' program, and I'm
trying to use the MAKEFILE.LCC... However, LC1 doesn't seem to like
the various .C files. I would appreciate any help, as my Atari C programming
is a bit rusty (Too long programming SmallTalk I guess!!)

thanks.

john..

No, this is wrong. I think it can be done only by writing a mouse
movement handler (vex_move?? or something like this) in assembly
since the OS does not support it.
evnt_multi also supports watching 2 mouse rectangles, if you want
to use the above "theory". But the mouse will be jumping by the edges of the rect.

Hi, I'm trying to get my ST on the net using STIK and the SLIP.emulator SLIRP.

But I'm having problems. Stik doesn't get further than 'Resolving Hostname'.

I've got two DNS-addresses, so that's not the problem. Anyone got any ideas?

Maybe STIK and SLIRP just don't like each other.

Thanx, Casper.Post subject

I don't know for certain, if it is supported, by new releases. Current [5.06.01] release in my possesion, is stable, works on anything from an St to Falcon, with all the
hooks to the falcon, and TT tos'es already. Complete with speedo/mTos/mint stuff. Works with Multitos quite well, with geneva 'sort of'.

HISOFT at UK is probably the European distributor.

I have heard no rumors, about an english doc'ed Pure C. There is an English online help package available for Pure C, from a third party.

Hi, I am using the GFA Basic Mydial routines supplied with the Interface resource editor. This consists of a a file called MYDIAL.OVL which has been compiled with Pure C and a few GFA Basic procedures to call the C code.

I am trying to use the 3D dialog functions supported by Mydial, but the switch passed when initialising Mydial has been left out of the C source used to create MYDIAL.OVL.

I have worked out what needs changing, but I am not a C programmer and do not have a C compilers. The docs for Interface ansd Mydial state that the source provided is intended for Pure C and will also work with Turbo C.

Would sone kind soul be prepared to compile the source to produce the MYDIAL.OVL file for me.

Many thanks in advance.

What version of STIK do you have? I had an earlyish version and there was
a bug in it which wouldn't connect past that point, try getting an update.

Also, you have to tell your server to make the PPP/Slip option Slip only
for your account, STIK doesn't like the PPP option.

You can used the newly proposed system-level SCSI driver interface - the
CBHD public domain driver uses this, and a detached SCSI driver is also
available. By doing so, your code will work on *any* SCSI interface where
a low-level driver is available.

If noone else does this, I will make this stuff available via FTP as soon
as it is complete.

Under SingleTOS, calling Malloc may cause serious problems. The memory does not belong to the accessory, but to the current application and will be freed when this application exits. In an accessory, the only reliable _and_ clean way is to work with a fixed heap. This may either be a static area stored in the BSS or memory allocated directly at the beginning of the accessory initialisation (i.e. after the startup code). Calling Malloc or other calls which may alloc memory (e.g. rsrc_load) at startup should be protected with a wind_update(BEG_UPDATE/END_UPDATE)-pair to prevent the autostart-application (if any) from being loaded too early.

Of course, if you make sure that you are in a multitasking environment (check the global-array, I think global[1] > 1), you may call Malloc without having to worry about the problem mentioned above. This is why your accessory worked with MagiC, but not with SingleTOS.

Hope that helps...

Ciao

Thomas

try this fragment of 68k assembler

```
reboot:
     pea  doit
     move.w   #$26,-(a7)
     trap #14
     illegal

doit
     move.l   $4f2,a0
     jmp  (a0)
```

Erm. Can you describe this a bit more? I'm using GFA, so I don't know if things like this
are possible. This is under normal non-mtasking TOS, yes?

Cheers

:-)

There is a TOS system variable called the current process pointer (or something
like that). Basically, under single-TOSes it contains the address of the current
process' basepage. All you do (!) is save the old value, then copy in a pointer
to your parent's basepage, call Malloc, then copy the old value back.

You can find a pointer to your parent's basepage in your basepage: I don't know
if GFA gives you access to this :-(

This stuff DOES NOT WORK (nor is it needed) under multitasking TOSes.

Come to think of it, perhaps you find the current process' basepage using the
ROM header. It is documented in things like the Compendium, anyway.

I don't think that's a problem, but I still don't know how one can
compile one's program and have control over what registers will be
used. Or do all C compilers save all registers before calling another
routine? I know that Pure C has a compiler option `no register
optimisation' which, when turned on, will make sure the contents of
all registers will be reloaded before any use. But this will
definately make things slower...

About the stack vs. register passing of arguments in Pure C (as
mentioned in Eric Smith's reply), I thought the FreeMiNT sourcecode
has been made with ingenious IFDEFs and such, so that when Pure C is
detected, all functions will have the `cdecl' switch.

The BAD MOOD internet project to create a FreeWare Falcon030 DOOM(TM)
WAD compatible game has recently taken a huge leap forward.
This is mostly thanks to the work by Douglas Little (of APEX media).

Version 1.32alpha of BAD MOOD is now available via WWW/ftp (see .sig).

So what's new?

- No more C code!
  The full '030 assembly code is included.
- Runs in Falcon true colour mode.
  Both RGB and VGA are of course supported.
- More than two times speed increase.
  In _many_ places it's _far_ more.
- The display can be resized.
  At 160x100 the frame rate is usually _very_ nice.
- All display glitches have been removed.
- A 2D map can be overlaid.
- Mouse control added.
- Some lighting effects.

...and more.
There's also a first DSP aware executable in the distribution archive,
which if course improves the frame rate... ;-)

For those of you without Falcon's, the C version of DVIEW has also been updated. Versions are available compiled for the old 68000 Atari's as well as for '020+ machines. These versions run in 16 or 256 colour bit plane modes. Full C sources are included.

By the way, it has been discovered that BAD MODD (and DVIEW) actually loads DOOM 2 and Heretic WADs as well as the original DOOM ones.
A tip: third party WADs work fine and are usually a _lot_ smaller than
the commercial/ShareWare ones.

Great... I should have repaired my ST by then... Will there be a binary distribution? I have Lattice but as I have just lost a hard disk I am having to squeeze down my system to a bare minimum... one compiler (gcc or Lattice).

How fast is it? What juicy information can you feed us about it :) No chance of a sneak preview I guess...

Does anybody know about any program to read Atari-ST disks on PC and make an image file of them?

I would like to put all my ST disks into image files in a PC CD-ROM.

Is it possible?
Has anybody try it?

I think the problem is with autoboot ST disks.

Please answer. A can only have one computer in my room :) and I do not want to forget my old faithfull ST :(

A PC formatted 720Kb (80 track, 9 sectors per track) disk can be read
and written by an ST. There are various ST disk utilities which can do
the same thing.

If my guess is right that you want to read any ST disk then you might
get better results posting in a PC group for disk utilities capable of
reading non standard PC formats. There must be something!

>I would like to put all my ST disks into image files in a PC CD-ROM.

A PC should be able to read the bootsector ok. The trouble is most
autobooting disks do so because they incoporate copy protection. A
capable piece of PC software will probably think it has copied it but
when re-installed the copy protection will be gone and the disk will
refuse to boot.

Hi,

is there any shell for the Atari that's 100% Bourne-Shell compatible?

I need it to port GNU-distributions which always require shell scripts
to configure the environment.

I tried BASH 1.13.1 that complains about "do"s on a single line, ksh
(4.8 MiNT r1.1Beta) that doesn't handle "for"-exit codes on premature
termination correctly, and sh from the MiNTOS 1.4.1 distribution, that
still requires GEMDOS-conformant suffixes to execute a program.

C-shells would be of little use as they are Bourne-shell incompatible
anyway.

There has to be a no-frills 100% Bourne-compatible shell somewhere?

Anyone got an idea?

Use select() to wait for new data from /dev/mouse and any other device
simultaneously. It looks like the MiNT mouse driver is compatible with
the Sun mouse driver. Type `od -ha /dev/mouse', start moving your mouse
and see for yourself. The only documentation I know of is the source,
I believe the mouse driver is in biosfs.c.

The easiest way to find out about that is to join our mailing list.
Information about that, as well as a lot of archived letters, can be
found on my WWW/ftp site (see .sig).
There are still no newer versions of DVIEW at the site, but the non-
distributed versions can now for example:

- draw in Falcon TC mode
- draw a rotating 2D map
- check sector height difference

We who started up the project have not had the time to do much about it
lately, but some new people have gotten involved.
One person is thinking of writing some kind of WAD editor.
Then there's Doug Little (of APEX media) and Dave Murphy (APEX?) who've
spent a lot of time the last week or so converting/rewriting into
assembler...
(I've not tried their demo version (distributed on the list today) yet,
but I'll do that very shortly. :-)

>:We want it, want it, well.... WANT it..!!!

Why don't you join the project then?
There are lots of things that need thinking about. Some would probably
not even need any programming experience at all.

>1) doom is old.

So?

>2) get any computer other than atari and you can play doom on it.

No need to get a non-Atari machine. Jaguar DOOM is great!

One day I think BAD MOOD will be playable as well, but _when_ is
anyones guess right now.
Again, join the project and make sure it's this millenium! ;-)

Anyone out there help me with the following???
I've written a program with one half (written in 68000
assembler) interrupt-driven off Timer A in the MFP chip, and the
other (written in C) performing housekeeping in a big polling
loop. Now I need one more function (probably in 68000 again) that
does its little job without interruption from anything, including
Timer A.
Can I accomplish this by writing 0x2700 to the status register at
the top of the function code (the entire program runs in
supervisor mode, by the way). If it is possible to disable all
interrupts 'by hand' as it were, what then happens to the timer A
interrupts (or indeed any other interrupt): do they 'wait' until
the function returns, or are they lost?
Any thoughts welcomed . . .

 THT> What is going on with the DOOM for Falcon -project 8-) ?

There will be some movement realy soon now. Doug have soon finished his rewrite and he have sent me an demoversion of it. It's faster and better looking than ever. :-) When he is finished with this one, he will move to the DSP and then things will start to get MOVING! :-))

 THT> We want it, want it, well.... WANT it..!!!

We all want it! :-))

cheers,

Does the adaptive prioritisation system in MiNT actually have any effect?
If not would it be possible to implement a system which set the backgound
processes to run on a lover level of priority, e.g like MagiX? Perhaps
some modification to the MiNT kernal source may be in order, where can
I get a copy for Pure C?

Does the adaptive priority system in Mint/MultiTOS have any effect?
By this I mean do programs which are running in the backgound actually
receive compartively less CPU time?

If not would it be possible to implement it in the MiNT kernal? If so
where can I get the MiNT kernal in Pure C form from?

Yes, and there exists a lot of .WAD-files out there, which are nice to be able to
play on the Falcon too.
- And by the way, you can't DOOM for the Amiga. (not yet at least)

Portlink ST - Program for file transfer between Portfolio and Atari ST
"""
Since the sales have been low I now release it into the public domain!

To companies that sell other products for communication Portfolio-ST:
this is not a rip-off, but a result of hard work and lots of research
with the help of other Atari ST developers both in Norway and Germany.

The ST software communicates with the build-in Portfolio file-transfer-

program and use the Portfolio parallel-interface and Portfolio-PC cable

The cable needs some modifications, but no one should have any problems
The communication speed is much faster than with a PC - And it's free !

Binaries & documentation at: ftp.oslonett.no/user/larserik/portlink.zip
or at ABK-BBS in Norway: Call +4767132659 and get the file PORTLINK.ZIP

Source-code is available on request, send email to adress in signature.

Subject: ST Basic -> Hisoft Basic (quite long)
Date: 1995/11/13
Message-ID: <13705@gos.ukc.ac.uk>
X-Deja-AN: 119284994
distribution: world
organization: University of Kent at Canterbury, UK.
newsgroups: comp.sys.atari.programmer

For the last few days, I've been desperately trying to convert an old ST Basic (yes I know, *puke*) program into Hisoft Basic. The first thing I did was just load it straight in and see how well it compiled.

It compiled OK, but there were a few bugs with the "graphics". I therefore started looking through the code, and trying to clean it up. No small task when all the control the program had was GOTO and GOSUB!!!!!

I've now got it reasonably respectable (i.e. subroutines everywhere, except for the main code, which is totally inpenitrable). The only problem is that there are a lot of weird POKE's around that I wish I could understand. I figured one type out, which drew a rectangle. It took the form:

```
POKE PTSIN,x1:POKE PTSIN+2,y1:POKE PTSIN+4,x2:POKE PTSIN+6,y2
```

I've now replaced most of these with the rather better:

```
v_bar x1,x2,y1,y2  :) :)
```

Below is an (admittedly rather long extract) of the code, I wonder if any of you programming gods (sluuuurp!) could help me decode some of it.??

     IF mx<550 THEN yes_no=1 ELSE yes_no=0
END FUNCTION
```

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/

Thanks for any help I may get.....

John

P.S.

Just in case anyone cares, the program is actually a bridge playing game which is really quite good. OK, not exactly very graphical but still good. I want to recompile it with Hisoft Basic, because running it in ST Basic is painful. So SLOW!!!

It is at least supposed to work, but not in such a ways that programs running in the backgound get less CPU. It's just supposed to give interactive programs a quicker response time and to punish programs polling the BIOS or running in supervisor mode for a long time.

Feel free to hack on the MiNT kernel. If you plan to do that, you should probably subscribe to the MiNT mailing list at <mint-request@terminator.rs.itd.umich.edu>; the list address is <mint@terminator.rs.itd.umich.edu>.

There are two flavours of MiNT: Atari MiNT and FreeMiNT; both are free and subject to the same licenses. You can get Atari MiNT 1.12 at atari.archive.umich.edu, and the latest FreeMiNT sources are at <URL:ftp://ftp.inf.tu-dresden.de/pub/atari/Mint/Kernel/>; I believe that v1.12.5 (the latest version) needs some minor tweaking to make it compile with Pure C. The next version (due early next year) will better support Pure C.

(I don't know if the original Atari MiNT 1.12 can out of the box be compiled with Pure C.)

I've heard of somebody (yes I don't know who) who has crosscompiled with gnu-c from a PC to an ST.

Does anyone know of a way to do so. I know that with djgpp you can create a coff for 68k processors. but can you also link it into a prg?

Thanks in advance,

Jacco van Muiswinkel

Perhaps the following accessory...

```
for (;;) {
     get events;
     if MU_TIMER   {
          if (
                         time > 3am &&
                         (
```

```
              appl_find(lattice) != -1 ||
              appl_find(Devpac) != -1 ||
              appl_find(Mon) != -1
              )
            ) {
            "Get some Sleep"
         }
     }
}
```

The details I leave for you.

I have been trying to port over a lot of unix source to linux68k
and keep getting very strange errors in preprocessing and have come
across this anomaly that maybe someone can explain to me .

BTW I have no idea if this is causing any of the problems but I would
like to eliminate it anyway ..

testcpp.c

```
#define ABC abc
#define DEF def
ABC+DEF
```

testccp.out

should read I beleive 'abc+def' .. instead it reads 'abc +def'

Can anyone explain to me what the space is being inserted that is not
expected ??

There is a Quicktime player available on Hensa. It has a special TC mode player which runs at a resnoble speed. I don't think the DSP is used for it so there may be room for improvment. No sound at the moment. I can't remember the name of the author at the moment but I think he was also resposible for the AVI player.

Hope this helps?

I understand that the top application can be given more CPU time than background ones by using the SLICES command in MINT.CNF. Try SLICES=4 or SLICS=900, and see if it makes any difference.

Hope that helps...

Subject: [Q]How to find and change top app. under MultiTOS?
Date: 1995/11/14
Message-ID: <48b5k5$3ab@status.gen.nz>#1/1
X-Deja-AN: 119363149
organization: Tariland Atari Computer Club, Auckland, New Zealand.
newsgroups: comp.sys.atari.programmer

I am wondering how I can find out which application is the "top" application under MultiTOS. I have found that I can check which application owns the menubar or the top window. However, if an application has a wnidow but no menubar, then the menubar system won't work, and if an application has only a menubar, then the window system won't work. Apart from trying to find a top window, and if not, then looking at the mnubar owner, how can the currently top application be found?

I also would like to change which application is currently the top one. I can send a message to the target application telling it to top it's window, but this won't work if the application has only a menubar and no window. What can be done in this case?

It must be possible, as the AES
itself does it (CTL/ALT/[SHIFT]/TAB, and in the desk menu).

Thankyou for any help or suggestions.

>up with some ideas.

As I said above, check out the WWW/ftp site for information, but I guess I
can repeat it here:

Send a letter to bad_mood-request@rand.thn.htu.se with the word 'subscribe'
as subject. You'll be added to the list and receive a short text explaining
how to participate.

With the recent work done by Doug Little and Dave Murphy, DVIEW is reaching
useful speeds. Their last version was more than twice as fast as the one
on the WWW/ftp site and had added mouse control and lighting effects. A new
one was posted to the list today. (I'm off home to test it ;-)
They're said to be writing some DSP code now...

This is because the ANSI C standard says that expanded macros
must be seprarate objects. If you _really_ need to get the
other behaviour (why on earth would anyone need that?) you can
use the -traditional flag to cpp.

I've got someone in the family who loves playing bridge. Could you
send me a compiled copy of the program, when you're finished?

It's been a while since I ran my Falcon in 'TOS' mode, but if I recall
correctly there are two separate linkers, one called gcc-ld, the other sym-ld.
You use the gcc-ld to generate a binary, and the sym-ld to generate a

separate symbol table.

Another problem that exists, I believe, is that the atari version of
gdb won't handle c++ mangled names correctly.

I suggest you find an Atari dealer (or distributor, or whatever) who can
sell you TOS 2.06. The only other alternative is to steal it, and I'm sure
you wouldn't want to do *that*.

At some point I thought I read something about a systemic way of
restricting the mouse pointer movement to a smaller, specific rectangle.
But now that I need to do this I cannot find any supporting documentation
reference. Is there a systemic way to do this or does it have to be
coded by hand?

Thanks for the help.

Hi,
     I'm trying to get back into programming GEM apps, and I thought
that I'd use the EGEM libraries, unfortunately I'm having difficulty in
compiling them using Lattice C 5.04. I've got a `Make' program, and I'm
trying to use the MAKEFILE.LCC... However, LC1 doesn't seem to like
the various .C files. I would appreciate any help, as my Atari C programming
is a bit rusty (Too long programming SmallTalk I guess!!)

thanks.

john..

Does anybody know how I can figure out (proper programming !) whether a given VDI-font is proportional or not ? There is a "proportional" flag in every fonts header, but it seems to me that there is no VDI call to read this flag. Of course, I can compare the cell width for all characters, but that method is awkward and slow, since the whole font must have been loaded before.

Thanks for any response, Peter

Do I detect the presence of the developer of MiNT? Welcome!

Eric, we've just been through a somewhat acrimonious debate on this subject. :) Since none of us have any kind of written license agreement for our TOS ROMs, we're reduced to trying to guess what may or not be allowed under the laws of our various countries. Buying a set of TOS 2.06 ROMs, copying them onto disc, and throwing away the ROMs is probably OK. Copying the ROMs in your machine and then vow-

ing never to use the copy and the originals at the same time may be OK too. Dumping a friend's ROMs onto floppy and using them in another machine is probably illegal, but would be a civil rather than a criminal matter. So it would come down to a question of how much damage Atari had sustained as a result of this abuse; say, $5 maximum. CA$:)

Morally, I'd put it at the same level as photocopying my colleague's out-of-print DSP textbook. And I don't lose sleep over having done that.

As I have said before, this whole problem would be solved if STonX were adapted to run with a replacement TOS such as Magic, or a free replacement for the Atari BIOS/XBIOS. (We already have a GEMDOS replacement in MiNT, and I believe STonX replaces the VDI).

Thank heaven MiNT comes with a written license, so we know where we stand on that one. :)

Hi guys,

I am trying to read the mouse buttons on an evnt_multi call, and yet the parameters require a mask and status for the buttons.

It seems that you can only look for EITHER a left button, OR a right button event, OR a both-button event, and you have to specify this in the call.

In other words, I want the one evnt_multi call to look for both left and right mouse clicks.

Any suggestions? (I'm using GFA Basic by the way).

I am currently studying for a BEng (Hons) Electronic Engineering at
Salford University. For my final year project I am building a bass
guitar to MIDI interface using the ATARI 520 ST as a system controller
and for its MIDI interface.

The hardware needed consists of an A-D converter circuit which is
interfaced to the cartridge port of the ST. I need to be able to both
address the cartridge port and to receive data from the port for
processing by the computer.

Can anyone give me some idea as to how to access the cartridge port
using my rather ancient version of C ?

Thanks in advance, John.

The simplest solution is to revert to polling. Use MU_TIMER with a delay of zero. Each time it comes back switch the mask to the other button. This is a bit of a bodge and can be fairly sluggish unless you are prepared to rewrite evnt_multi() in assembler.

Other solutions are possible, such as accessing the LineA variable table directly. This is faster but circumvents the AES and can cause more subtle problems.

Spencer Davies (Spencer@mettav.demon.co.uk) wrote:
> am now using an unaccelerated Falcon instead (why are compiles under Lattice
> so slow????)

Because Lattice insists on making two passes through each file, and
writing the info out to disc as it does so.

Laser C (by Megamax [who are no longer in business, I believe]) only ever
made one pass through each file and only ever wrote the data out to disc
when it had to - everything (source, headers, object, executables etc)
were cached in RAM by Laser. The Laser C cache dynamically resized itself
as needed and flushed itself to disc when it became full, or you quit
from Laser.

(I used Laser C from 1989 to mid-1991, when, having become sick of
waiting for the ANSI upgrade to "K&R" Laser C, I bought Lattice C.)

So, my Mega ST at 8Mhz with 4Mbytes of RAM was almost as fast using Laser
C as my 20Mbyte 32-Mhz TT is now using Lattice C 5.6.

If you want to speed up compilation, set your QUAD environment variable
to point to a RAM disc, and put all your headers and libraries in there
as well. This will speed things up, but dont expect miracles.

GFA will not work with MAGIC or with a lot of replacement desk tops. It allows
for somewhat faster development in my opinion than Hisoft if the limitations
are not a great concern.

I am looking for a version of Basic which will allow me to QUICKLY create
forms, buttons and menus etc on the Falcon. I also need it to allow the
execution of external programs for example accessories which play
AVI's, MPEGS and music/speech.

So which is best for making quick prototypes GFA or Hisoft Basic?

AFAIK TOS 2.06 has only been sold in ROM. Nowadays, it's hard
enough to find someone who's still selling the ROMs (System
Solutions maybe?).

Use the following values:

evnt_multi(evnt_mask,0x102,3,0,...)

This allows you to detect both mouse buttons as well as double-clicks. For triple clicks use 0x103.

Ofir ogal@cix.compulink.co.uk

I'm having problems with fputc and fgetc in TURBO-C.

The problem is that when I try to write a LF with fputc I get both a CR and a LF. When I try to read a CR with fgetc I get nothing.
I tried to get around the problem by direct use of fwrite and fread but that did not seem to do the trick. Does anyone know if this is a problem with the routines in TURBO-C or if it is a more general problem with the atari ST?

/Patrick.

RE: ARGV PROTOCOL

ARGV protocol is an extension of the 'old' basepage method of passing arguments to functions. It originated in MWC and was adopted by ATARI with a minor change from the MWC implimentation. [Terminating the environment after ARGV found]

to use check the size byte 128 bytes into the basepage. If it is NOT 127 then the protocol was not used.
walk the environement strings [pointer to them is in the basepage] until ARGV is found.
replace the 'A' with '\0' and skip to past next '\0'.
the program name,followed by the preparsed C strings stored sequentially ending in a double \0.
ex: ARGV....\0prog name\0arg1\0arg2\0arg3\0\0
See compendium. or argvspec.arc from umich, etc.
The first 125 bytes of the command are stored in the basepage so that programs not using ARGV protocol can attempt to recover some of the arguments.
sed 's/[\t]+/white space/g' aa.txt ab.txt ac.txt has extended portion of environment
ARGV...\0sed\0s/[\t]+/white space/g\0aa.txt\0ab.txt\0ac.txt\0\0
This aids programs that are 'symbolic' links, [gzip,zcat ungzip] or programs with a multitude of arguments like
ld ... *.o [shell expanded]
See Compendium for details. This is from memory....
see also argvspec.{arc,zoo} [forget which] on umich mirrors...

Hi there !

I was wondering what programs there are for MIDI-connected Atari STs.
Could u PLEASE help me !
Of course I know MIDIMaze (2 and beta-version of 3), but there must be more than that ! or not ?
BTW, I'm about to write a few programs that make use of the MIDI-net myself !
(right after my exams now ...)

* Are there still people, who write MIDI-net-games, or at least WANT some new ones ?

* What the hell is available anyway ???
  (I would like to make a list of all "Midi-net-workable" stuff ...)

* And is there still somebody wroking on MIDIMaze 3 or was that project given up ?

! please folks ! I need some answers !
(best per EMail -> <NIP73@rz.Uni-Kiel.d400.de>
... I'll send a follow-up myself if it's worth it ;)

Hello!

I'm writing this on behalf of a friend of mine, and I'm not perfectly sure whether my choice of group is appropriate.

Anyway, he's looking for info about the Atari Portfolio, especially concerning low-level programming of it and its hardware. Thus, all information such as interrupt lists, ports, screen access etc is greatly appreciated.

Mail reply to jens@mailbox.calypso.net is preferred.

Regards,

Jens Larsson

Alternatively you could take a lower level approach by using vex_motv()and vex_butv()
to hook the vdi's mouse handling routines directly. This is what I do in XaAES (but then, I had to, as XaAES runs from MINT.CNF, before the GEM AES has been initialised).

A better idea is to stop using GFA and rewrite in C (or C++ / Objective C if you are
feeling adventurous).

Craig.

You'll get the same with DOS. '\n' is a single ASCII character, however under
TOS and DOS, lines in a text file are ended with *two* characters. If you
open the file as a text file (fopen("filename", "w")) all the fput/fwrite
calls will translate single '\n's into '\r\n's.

Just open the file in binary mode -- fopen("filename", "wb").

Subject: Pfork in MiNT doesn't work??
Date: 1995/11/02
Message-ID: <47ad2o$5hs@nntp.hut.fi>#1/1
X-Deja-AN: 118472744
distribution: inet
organization: Helsinki University of Technology
newsgroups: comp.sys.atari.programmer

Hi, I have troubles getting Pfork to work in MiNT (MultiTOS).
It is supposed to create a copy of the current process and
run the new and the old process at the same time, right?

Well I couldn't get it work, so I wrote a little program
that tests it:

```
main()
{
     long a;
     a = Pfork();
     printf("Pfork: %d\n", a)
     if (!a) something();
     else something_else();
}
```

This is my test program in principle. But what did come out?
Printf came only once, resulting 0 (ie. run in child), and
the main program was back running not before the child
had finnished!! Could someone please help me. This is
a bad problem :-(. Because of this, It's impossible to
make a GEM program wait for AES events and MiNT events
at the same time (I mean MiNT's pipes with Fselect).

I'm using Lattice C 5.6 together with FreeMiNT 1.12h4 and
MultiTOS AES 4.1

 But only a few Falcon-user are owning such speeders. We don`t want to make demos

only for a few persons, but for all Falcon-owners (even if they have to connect an RGB-monitor). Surely we could do much neater effects by using speeders, but that's not the point. Our aim is to do neat effects _without_ using any hardware-expansions. If there will be more speeded Falcons in the future, the scene may use them, but actually it makes not a lot of sense...

All the CPX code I've seen (and written!) contains an appl_init call
in the cpx_init function, but nowhere does it actually do an
appl_exit.

AES 4.1 certainly keeps some kind of state for an appl_init call,
as successive calls to the CPX (and appl_init) return ever-increasing
application IDs.

Should CPXes call appl_exit? What does appl_exit *really* do?

Hi, I would like to try PUG / test it for you... however, I dont have Mark
williams
C. I have GCC, and have been trying to find a nice modern GEM library that I get
to
work...

My system is a 4mb Falcon using AES 4.1 with MiNT 1.12... My GCC version is 2.6.3,
but I have yet to succeed in getting it to compile any GEM program that I have
written with Prospero C...

The docs for AutoZeST mention that the author saw a colour version
running at a computer show, and I've seen a couple of programs (eg SoundLab)
that look like AutoZest interfaces. Is a colour version available, either
from an ftp site, or from a freeware/shareware author.

At the moment, I'm using a mono emulator to create screens and only using
the top half, but this causes a few probems with aspect ratios,
especially with text and slider bars.

thanx

E.L.F. Software
Sale Announcement

From now until Christmas '95, the English version of Pure C's help files will be available for half off the normal rate. For a mere $25 U.S. you can have hypertext documentation corresponding to over two megabytes of source text.

Not only does this include all of Pure C's features (some of which were previously undocumented), it includes descriptions for every function in the link library, both C and assembly language references, a memory map, and hardware documentation including such things as the SCC and SCSI controller register descriptions (not available in any other Atari reference).

If you have Pure C and are not using the help feature, you're missing out on half of power of the Pure C development package! Nor will this deal be available again.

Send a check, cheque, bank draft or money order to E.L.F. Software, 9614 Oregano Circle, Houston, TX 77036. There is a $5 service charge for non-USA postal orders.

P.S. This package includes a free upgrade to Pure C 2.0 when it becomes available. Also, the install program require 2 Meg RAM.

The dumbest thing I've ever done was trying to program in 'prolog'. Took me at least four hours to figure out just how to get started. Then four hours of implementation. Then another four hours to finish it. Then four hours more trying to understand why it works now, and not before!

But it looks like it was written in just ten seconds. :-)

Hi,

Does anyone know how to program in GFA Basic,
to play simple .SND wave files?
Send me the information please.

Greetings, Jan Dooms. <jandooms@tornado.be>

Cool... this is already the third efford towards an MiNT specific AES replacement I've heard of (the other two being "MINA" by Martin Osieka <Martin Osieka@MZ.maus.de> and "Sigma" by <Jens_Hiescher@b.maus.de>).

How do you plan to distribute your AES -- commercially or as freeware? The "X" in "XaAES" sounds like it will work on the top of X11, is that true?

I've already announced the following in maus.gui.gem, and this is a good opportunity to repeat it here:

I'll donate DM 200 (something like US$ 130) to anyone who holds a copyright to a working AES 4 replacement (MultiTOS workalike) and who is the _first_ to place his AES sources under the GNU License (GPL2).

One person already announced to support this "sponsoring program" with DM 100. Anyone else?

Hello evryone.

I'm a newbeginner in GEM using Pure C and I want to try to make a simpel phonebook that calls the number I chose. So I wonder if anyone can give me a clue or a little sourse ex that show us how to use bconout, bconin and so on. In the end we will use this type of functions to send/reasive things thru the cartridge port but thats a later problem. See you.

Does such a tool actually exist? It doesn't sound like it'd be TOO hard
to write... A TSR that checks the time every so often (via the VBL) and
which program is currently running ought to do the trick. I imagine the
hardest part would be figuring out if one of the three programs you
listed is running. (It's been quite a while since I programmed on the
Atari, so I'm not sure about that last bit.)

: Greetings, Jan Dooms. <jandooms@tornado.be>

Are SND sampled sound files? If so, there's a bit of binary code
(BASCODE.EXE) that's used in a lot of GFA programs to play such sounds.
I'll see if I can dig up the code.

XaAES ain't AES.
A replacment for the GEM AES written exculsivley for MiNT. Written by me.
First beta at the end of November.
More details to come nearer the end of the month.

Craig.

But aren't you already doing your demos for only a small number of us?
I can't believe the majority of Falcon owners use RGB monitors.

Anyway, I think the point about the bus acceleration was that a Falcon with
such could possibly handle the normal RGB demos' bandwidth requirements
even if it was using a VGA monitor.

:) - I guess it's all wide open. We'll have a compo to see who's is best, then everyone can use that.

> How do you plan to distribute your AES -- commercially or as freeware?

I'm going to release source and binary distributions. I'd love for people to change the code, improve it and send me patches to include in subsequent versions. It's being done that way as I don't program atari for money, just for fun. So, freeware...

> The "X" in "XaAES" sounds like it will work on the top of X11, is that
> true?

No, that's a little miss-leading. The X is for Xperimental, or Xtended, or Xpandable. It does have a little in common with X11 in that it is client -server based (uses pipes to go between client apps and the GUI server). Don't worry though, the trap handler interfaces to the pipes system so that ordinary GEM programs still work, but don't sit in super mode at all.

Gimme Gimme Gimme - well, I said it wasn't for the money, and it isn't

(but that said, money is always nice). I'm releasing the source regardless though (note that they are for Lattice C, not GNU or Turbo).

Craig Graham.

Here's an extract of code I use with vro_cpyfm, the first function should be of interest to you as it fills in MFDBs. I've added comments to what I can remember.

I wrote it to store and then restore parts of the screen screen, sbn keeps track of the last block saved and this is always restored first - I use it to restore the screen after a dialogue has exited.

```
MAX_SCR_BUFFERS
5

void
*scrn_buffer[MAX_SCR_BUFFERS];
```

```
char
sbn=0;
short scr_xr, scr_yr,
scr_nplanes;
MFDB sblock,
mblock;

void fill_mem_MFDB(short
pxy[4])
{

mblock.fd_addr=scrn_buffer[sbn];
    mblock.fd_w=(pxy[2]/16+1)*16;   // Width of block in
pixels
    mblock.fd_h=pxy[3]+1;           //
Height..
    mblock.fd_wdwidth=pxy[2]/16+1;  // Width of block in words (I
think)
    mblock.fd_stand=0;              // Device specific format (leave
in
                                    // screen
format?
    mblock.fd_nplanes=scr_nplanes;  // Number of screen
planes
                                    // (=work_out[4] given by
vq_extnd)

mblock.fd_r1=mblock.fd_r2=mblock.fd_r3;
                                    // Reserved for future use, I
forget
                                    // why I did this, it may be a
copy
                                    // of someone elses
code
}

char v_save_screen(short
pxy[4])
{
long
mem;
short
bxy[8];
char
done=TRUE;

v_hide_c(handle);

    if(sbn<MAX_SCR_BUFFERS)
{
        // Calc memory
needed
```

```
mem=(pxy[2]/16+1)*2*(pxy[3]+1)*scr_nplanes;

        if((scrn_buffer[sbn]=Mxalloc(mem,0))!=NULL)

Sounds nice!

How far away from releasing a first version do you think are you?

Be sure to drop me a message when you're ready.

Using Lattice doesn't mean that it will not be portable, does it? Are
you using any Lattice-specific features/libraries?

Michael

So it seems. My Lattice C documents didn't say anything about this.

```
>    sprintf(a2,"%d",V_handle);
>    if (!Pvfork())
>    {               // In child here
>        execl("mousesrv.tos","mousesrv",a1,a2,NULL);
>    }
```
>This definitely works (compiled with Lattice C 5.52).

But to use that I'd have to have two separate programs (if
I understood correctly). Anyways thanks for the bit,
maybe I find use for that if everything else failes.

>(XaAES is a MiNT specific replacment AES I'm working on)

That's great! Good luck to you with that project.. This
remains me, I once tried using tfork command out of MiNT
libs (this command spawns a function running at the same
time in the same memory as the parent). Now when I tried
making AES calls from this spawned process, they didn't
work (not even after appl_init). I just thought, this
probably was a problem with AES, so maybe you could correct
this.

I can understand your statement. It's also very fair :-)

But what I`m trying to say is that it would be nice to have an option like - say a
menu
in the beginning of a demo (or game) that asks what kind of computer one has.
Like:

1. standard Falcon (4 MB, 16 Mhz CPU, 32 Mhz DSP) (RGB/MultiSync only)
2. Falcon (4 MB, 36 Mhz CPU, 32 Mhz DSP) (VGA/RGB)
3. Falcon (4 MB, 36 Mhz CPU, 50 Mhz DSP) (VGA/RGB)

Press 1-3 to choose config.....

The game me and my friend is writing will be supporting accelerators
like the above.

Keep Cool and Flying...

ChainXOR...

Wait a minute - why only Lattice? It's bad enough that I can't
compile the MiNT kernel in Pure C, but as Lattice C is commercial,
this is even worse.

Is this limitation fundamental?

Good luck with the project! (Sounds immense to me...)

I'm aiming for an initial 'techie only' release at the end of november and a full
blown general release in January.

> Using Lattice doesn't mean that it will not be portable, does it? Are
> you using any Lattice-specific features/libraries?

No, it just means that I'll be building with Lattice as it compiles faster
and uses less memory than GNU. I don't use any of the Lattice libraries at
all, just the MINTLIBs and standard VDI library.

It should compile ok with GNU or Turbo, but you'll need to change the project
files
a bit or do a makefile for GNU.

Craig.

I say again (for the last time):
I own a falcon, not a TT. Compile times with GNU are far to long to be practical on my system, and resource usage is to high - I have 4Megs, and my development system is to hang XaAES off trap 3 whilst I'm debugging, and run it in tandem with AES4.1, so I can use the console windows and GEM editors. Using GNU, I don't have enough memory to compile doing this on a 4Meg machine, with Lattice I do. It makes no difference to end users, or in terms of compatibility
as I am still using the latest MINTLIBS with Lattice - just like you would with GNU. I have no intention of using GNU to develop with until someone gives me (for free):

1) An accelerator card or a TT/Medusa/Eagle
2) More memory
3) A much bigger hard drive (I already have Lattice & Turbo C installed, I don't have space for a third compiler installation).

As no-one is going to give me those, lay off complaining that I'm developing with Lattice ok? Or I'll buy a PC and develop with Watcom and bugger you all ;)

Craig.

Most of what you need you can get from a.a in Languages/c68_445b.zoo.
You'll also need the linker and preprocessor from the SozobonX package
at ftp.fu-berlin-de:/pub/atari/programming/sozobon. And I don't
remember what version of the libraries came with that package; if it's
older than pl46 (as noted in PatchLev.h), you'll need to get
Mint/Lib/mntc6846.zoo from a.a to update them.

>   I an make do without some of the graphics libraries
>untill I get a hard drive so could anybody help?

Which graphics libraries do you mean? I'd advise against using SozobonX
libraries with c68; there will be incompatibilities.

Hi !

I have a problem with using Gdos in my own programs. I don't really know how to get the number of lines which I can print on a single Letter-Size page. I used to divide the maximum vertical pixel position through the character height. Is this the right way ? It would be very nice if you could mail some sort of Pascal or C listings from which I can learn how to correctly use the Gdos-calls.

Thank you very much and please excuse my bad english,

markus.

Probably because this example assumes that one file contains all source code. In real life that's unlikely to happen, unless you write some trivial software, in which case you would hardly be using the MODULE directive at all. :-)

I amssume you used mfsconf to make the partition.

There should be an option to revert a Minix partition to TOS in there.

Read the docs in the source distribution for more information.

Are you using an ST? If so, you are probably experiencing buffer overrun when
reading from the MIDI port. There have been articles written about installing a
larger buffer (through iovect I think.) to prevent this from happening.

I have written several programs that use this approach and have not had any
more problems.

Would you like some example code?

First I want to say I am sorry that this has nothing to do with the topic of this group. You may see this message in other newsgroups, the reason is I am subscribed to those too so please don't flame me. I have been posting and reading to this group for a while. I just wanted to let you people out know there is a way to get Cable TV for FREE. I recieve this letter in the mail from a friend that had told me it works. I gave this to one of my friends and he had free cable in his house within 20 mins. I have not tried this method yet but may soon try if my cable goes up in price. If anyone would like a copy send the following to the address below.

Address Envelope to:

FreeStuff
9393 N. 90th St.
Suite 102-289
Scottsdale, AZ 85258

Enclose in the envelope:

Send...

$1.00 U.S MONEY *** NO COINS *** NO CHECKS ***
inside a sheet of carbon paper or construction paper,
and send a *self-addressed*,*stamped* envelope to the
address above.

Thanxs,
Just think if you pay 30$ + a month. 1$ will save
you 359 + dollars a year.

I think that the problem is probably in your code and not in Lattice'
malloc. I use the standard malloc/free a lot, sometimes with a "wrapper"
that does extra checking, and have not found such problems.

Hi,

Perhaps someone can help me with this problem:

I am developing a quite complex and huge program in Lattice C v5.6
and I call malloc() and free() a lot. The program crashes
randomly (sometimes the machine reboots in the middle of the ROM,
as I debugged) and these crashes are difficult to reproduce.

Yesterday I realized (during debugging) that the malloc() returned
an address which was ALREADY allocated and was not supposed to be freed.
So the program used the SAME memory location for storing 2 things
at the same time!

My questions are:
- have you ever had problems with memory allocation in Lattice C?
- is it possible to "steal" a malloc and free from other libraries,
  and which one is the most stable?
- can I find some usable sources of malloc anywhere?

Any comments or suggestions are welcome.
/Attila

How do you calculate this? I've got an 8Mhz STe with a 38400bps mod and can
quite happily exceed 3000 CPS on a 14K4 connect (uncompressed text such as
Fido netmail).
.. If at first you don't succeed, forget it.

The mintlib sources can be compiled with gcc, pure-c and lattice-c.
No need to go looking for a `port', the #ifdef's are already part
of the original beast.

PBS or Persistent Bug Syndrome
==========

Take one tired programmer, one large application, lots of source files, lots of header files, a resource file, a touch utility, and a makefile:

1) Make minor change to a header file.
2) Fix bug in one source.
3) Add a bit more code to another source.
4) Use touch to "save time recompiling everything".
5) Spend rest of day messing with (1) and (2) having forgotten about (3).
6) Realise finally that bug in (2) was fixed but new one exists in (3) which of course only got compiled the once.
7) Make solumn promise to self never to use touch again.

I have a program that called Mxalloc alot and problems occured which seem
to be related to the 40 folder bug, the same message appears (use
FOLDRXXX.PRG, etc and actually increasing the slots for folders does get
rid of the problem). I reduced the number of Mxalloc calls by a big factor
(at least 10 times less), in the program and the problem has not reappeared
since.

Alan Holub had an article in Dr. Dobb's Journal a few years back talking
about problems with malloc() and free(). Basically, suggestion was to
write encapsulating routines for malloc() and free() and keep track of
the pointers that go in and out. Let me explain in more detail:

Write a function called tst_malloc() that calls malloc() to get the
memory block you need, and before it returns it stores the pointer in a
global array used to retain such pointers. Write another routine called
tst_free() that removes the pointer from the global array and then calls

free() to free the memory. Additionally, your tst_malloc() routine can check the global array for the existence of the pointer and write a diagnostic if there is a problem. Also, your tst_free() can make sure that the pointer you are freeing is *in* the global array before freeing it

The only thing I might add is *never* try to free a the same block (poiinter) twice--and *never* free anything that you did *not* allocate with malloc(). Also *never* use a block from a pointer *after* you have already freed the block with a call to free(). The above test routines will detect these and you can write out a diagnostic.

What are the dumbest things you have done whilst programming the Atari? Something that takes ten seconds to fix, but you took four hours to work out what that ten second fix was?

In my case, I have just spent three-quarters of an hour wondering why my round radio buttons like the Mac and PeeWee (which used a user-defined drawing routine ie it was of type G_PROGDEF) in a windowed dialog box would not select and deselect properly.

I searched through the source code. My program was recieving the mouse-button "click", I was responding to it by inverting the SELECTED status of the "button". The code to draw the "button" looked at whether it was selected or not and acted correctly.

My code was doing everything right. Except it just didn't work right.

And then on a hunch I noticed that it wasn't SELECTABLE. That ten second fix was all that I needed to do. Now it works properly.

Has anyone had any other "four hour" ten-seconds-to-fix errors like this?

The fix for this is to alter the _MSTEP global variable. Simply include a
line like "unsigned long _MSTEP = 262144" in one of your source files as
a global variable. This value should be an initialised global variable,
and treated as a "const" variable (ie not altered from within the program)

Each time a malloc() call is made, and enough memory is not available,
malloc() will gazump another 256k (262144 bytes) from the computer.

(I do not have the 5.6 manual to hand, but the 5.0 manual describes this
on page 212).

The only problem I have had is if I allocate an enormous (several 1000s of objects) linked list of smallish data objects (6 - 10 WORDS) and then free quite a lot of the members of the list (10-20%) here and there, joining up the links the performance of subsequent memory allocation is VERY seriously degraded by the ensuring fragmentation.

Thanks, I have been using a custom routine which allocates a whole new block before it releases the old one, *just in case*. I'm more than happy to be able to trash it!

Hello everyone,

I have just had PowerUp2 (32MHz accelerator) installed in my Falcon by System Solutions in England. I am very happy with it - GemBench shows a CPU increase of 40% with an overall increase of around 16%.

However, I have one problem - when I start Linux PowerUp is
switched off. I got two little TOS programs to switch it on and
off but I need something to do this when Linux is running.

Does anyone know of any Linux binaries to do this? Alternatively
I could knock something up myself if somebody could point me
towards how to access the keyboard controller - apparently a
spare switch is used for PowerUp.

Thanks in advance,
    Piers

Oh yes....

One last week was that in my STOS Falcon extension, I could not work out
why my bitplane graphics routines came out wrong every time... I spent
ages looking at the code, trying to figure out why it just displayed a
load of garbage...

eventually, I gave up, and went to fix another bug in the Set FV command,
which sets the screenmode. At this point, I discovered that I had not
set my internal variable PLANES which stored the number of bitplanes...

Argh....

Anthony

I am looking for a copy of the manual for Mark Williams C. I purchased the software several years ago but have since misplaced it. I also have the GST Macro Assembler but both the my original and backup disk is damaged. It has been a while since I have done any programming on the Atari ST and want to write some MPE modules for Dr. T's KCS Omega System. Can anybody help me? I am willing to by the software...

: Has anyone had any other "four hour" ten-seconds-to-fix errors like this?

I can think of one major screwup I've made, and one of the aforementioned "four-hour-ten-second" bugfixes...

The major screwup happened over a year ago. I was set to release a program of mine, and it was to be debuted to the viewing audience at a local usergroup meeting. WEll, all was going well -- save for a few last-minute changes and bugfixes which cropped up right up until the day of the debut -- in fact, right up until an hour before I left, where it suffered several recompilations and reconstitutions into an install disk. Several days after its release at the meeting, a beta tester informed me that whilst playing around with it, trying to get it to crash (I instruct all my beta testers to try and crash the thing as best they can aso as to flush out unwanted bugs), he informed me that pressing one key brought up a dialog box that gave registration code to register the program. DOH! It seems that though I removed all _visible_ traces of this development hook, which was there for my own testing purposes, the code was still there (I thought I had commented it out for the first

release) and still accessable if you knew where to do it. I quickly had
to release a quick bugfix -- which did fix some legitemate bugs, but also
removed this rather fatal (to me, anyway :-) development hook. That's
what I get for doing last minute rush jobs...

Then there was the time I spent absolutely hours trying to hunt down an
errant bug in the program which, in the final analysis, turned out to be
a misappointed variable. (Those subtle mistakes are always the most
difficult to find, and the easiest to fix) Fun, fun, fun...

Yes, my program kept once crashing when entering malloc or
free calls (seemed quite random, but later I was able to reproduce
a series what to do to make it crash). The problem was that the
program ran out of stack. I had disabled stack checking so
it didn't say anything, just crashed. I increased the stack
size and it worked fine again... hope this helps.

I still want to use Mxalloc, if an Atari has FastRAM I want my progs to use
it.

Has anyone got any safe routines, preferably in
C?

I am attempting to create a freeware listing of
shareware authors and how to contact them. If you are
a shareware author and would like to be included in
this document, please reply via e-mail (no sense
cluttering up the newsgroups more than necesssary)
with the following information:

Author name:
Company:
Products:
E-Mail address:
Mailing address:
Business Phone:

Types of payment accepted:
Web Page:
Where to find your programs:
A BRIEF description of your products: (Try to keep it
under 256 characters)

Thank you.

Todd F. Herschberg

Updated: 10/15/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
I can not keep up with the newsgroups, so please use one of the below
ways of contacting me.
You can contact me at:
BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
WWW: http://www.lm.com/~asmodeus/
there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on
an idividual basis per order. All prices are in US Dollars, and payment
is to be in US Funds. Money Order payments will be shipped the day
after I receive payment, and personal checks payments will be shipped when
the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.
COMPUTERS:
1040 ST/F 1meg memory $130.00
1040 STE 4megs mem. $300.00

MONITORS:
Color Monitors atari brands $100.00
Color Monitors atari brands $100.00
(P) Color Monitors(broken, power box) $25.00
SM124 Mono Monitor $75.00

STORAGE DEVICES: (Hard drives and Floppy)
Indus GT External 720k Floppy $70.00
Toadfile 130meg + 80meg HD w/ICD+ host $250.00
ShoeBox 80meg HD w/ICD+ host $110.00
20meg shoebox, atari adapter $90.00

OTHER HARD WARE:
WICO Bat-handle joystick (9-pin) $10.00
Epyx The Grip joystick (9-pin) $10.00
The BEst TrackBall $20.00
The Cordless Mouse (Practical Solutions)$30.00
Mouse Master $20.00

VIDEO:

Video Key	$30.00
ST Video Digitizer	$15.00
The Complete Colour Solution (Sold ONLY as a set) (Vidi-ST, Vidi-RGB and VidiChrome ST)	$90.00

AUDIO:

Stereo Replay audio digitizer	$85.00
ST Sound Digitizer (Hippopotamaus)	$25.00

PARTS:

2 assorted Atari internal floppy drives for parts	$8.00
1040 case and rf shield	$10.00
4 Atari 256k Simms from Ste (Make Offer)	$35.00

ATARI SOFTWARE FOR SALE

(SHW) = Still in shrinkwrap
(P) = pending payment
(SOLD) = item has been sold

Disk |Manual ||Box	Software Title	ASKING PRICE

Hi, does anyone know how you find out how many planes there are
in the current resolution?? I have looked through the hardware
docs that are all over the place, but this only gives true-colour
256 and mono....

I cannot use x=Vsetmode(-1); as the screenmode is not being set
this way... (Its using .FV files, which contain a dump of the
video registers, so that custom resolutions can be used...)

Anthony

EPUBLISHER: your manual writer

Advanced Control Data introduces EPUBLISHER, your electronic manual writer
for Windows.

The idea:
EPUBLISHER, a professional editor/drawer/painter program for Windows

(like CorelDRAW,Pagemaker, Ventura Publisher, QuarkXPRESS), allows you to create documents with fonts, drawings, colors, but unlike conventional desktop publishing packages, Epublisher generates a very special output: a very short ASCII command set. The length of a full color screen is less than 1000 Bytes, so a full 1000 screen size manual with jumps, graphics, and fonts is less than 1MByte.
On the client side, (WWW browsers, or your program manual on disk, etc.) users use a free viewer, EPUBVIEW, to execute the commands generated by EPUBLISHER.
In programming terms: EPUBVIEW is a graphical interpreter.

This unique technology allows you to generate many documents with full desktop publishing features and allows you to send them over the wires within seconds or if you write a manual, it occupies only a few kilobytes on your floppy disk that you distribute.

The screen oriented output offers you new features:
* inserting buttons and icons into your document where readers can click and jump,just like in an online service
Your manual is practically a small BBS engine on a floppy disk.
* using colors for coding text in your document is a new feature that has just been introduced and that has never been possible before.
Example for color coding: you can build up your document in red color for main text, blue for comments to go along with the document, and green for headings and titles. users can extract text of any color from your document and save it in a new file.

Please visit our WWW site for more information:

http://www.restonline.com/acd/info.html

Information specific to manual-writing:

http://www.restonline.com/acd/epbmanl.html

Sincerely:
Laslo Chaki
Advanced Control Data
Voice: (714)8379659
EMAIL: lchaki@deltanet.com

PS: We introduced EPUBLISHER for the NET a couple days ago.
Here are a couple of EMAIL we received:

From: an America Online engineer

Hi, Laslo:

I just took a look at your Web site . . . very interesting!

Your best next step to be considered....
Thanks,

From: a print publisher consultant

Hi Laslo,
I think you are on the right track. My company works with many print publishers who want to move to web publishing.
Good luck,

From -3511883451449518224

About one month ago, Jan-Olof Granlund posted a software announcement for the JDEB High Level(Source) debugger for Lattice C. When trying to obtain the file from ftp. uni-regensburg.de, the file jdeb_ok.lzh still shows up as being in the incoming directory and does not allow downloading.

Has anyone downloaded the debugger? If so from where? What is the debugger like to use? Any help would be greatly appreciated as could really use a source level debugger for Lattice C 5.6.
Thanks.

Dear Atari-programmers,

I'm working on a piece of software that should, in it's final stage,

end up as an electo-acoustic measurement-workbench for the FALCON030.
(And give me something to write about in my Diploma-Paper)

Currently i'm trying to implement a variable Sinegenerator on the 56K. Well the generation of the sinewave is already working. What still gives me a bad time is that the falcon hangs it self up during the parameter-passing.

To pass the parameters, I use the known way via Trigger_HC(13) and Dsp_BlkUnpacked() (my source follows). Frequency changes require to change two parameters, hence this mechanism is called twice.

On the second round (faktor_2), that means the third call of Dsp_BlkUnpacked(), the busy bee shows me that the FALCON is on its way to eternal nirvana. BUT WHY ?

Now here is what i do :

```
#define  INT16    int
#define  PAR_1    0x0L
#define  PAR_2    0x01L

long  cvt_2_dsp_fractional(double fractional);  /* converts floats into 56k-format
*/

main()
{
   static long faktor_1[2] = {PAR_1, 0L}, faktor_2[2] = {PAR_1, 0L};

   faktor_1[1] = faktor_2[1] = cvt_2_dsp_fractional((double)0.5);
                                        /* converts floats into 56k-format */

   dsp_downld_para( 2, faktor_1);   /* sic! */
   dsp_downld_para( 2, faktor_2);   /* sic! */

}
/***********************************************/
   void
dsp_downld_para(INT16 n, long* array)
   /*
    *    n == number of parameters to be passed.
    *    array == adress of paramter array
    *
    *    schickt die neuen parameter an den dsp, und ist noch universell
verwendbar.
    *    Benutzt Hostvektor $13 f□r Dsp_TriggerHC. Das DSP-Proogramm muss das
unterst□tzen
    *    tut es das nicht bleibt das Hostprg. im Dsp_BlkUnpacked h□ngen und daaas
wollen
    *    wir ja nicht oder ?
    */
{  INT16 i;
   long* p;
```

```
   p = array;

   Dsp_TriggerHC( 13 );       /* das ist der Interruptvektor der die Daten
reinholt */

   for (i=1;i<=n;i++)
      {
         Dsp_BlkUnpacked ( p, (long) 1L, 0L,0L );  /* Die Steuerwerte
r⌂berschicken */
         p++;
      }
}
/***********************************************/
```

Now on the DSP-side :

```
;-----------------------------------------------

HTX      EQU     $FFEB           ; Host Transmit Data Register
HSR      EQU     $ffe9           ; Host status register

   org   p:$0026
   jsr   do_hostin           ; neue Steuerdaten vom Host abholen, ⌂ber
                             ; DSP_TriggerHC($13) ausgel⌂st.

;----------------------------------------------------
```

I use PureC 1.1, ACS 2.17 for the GEM Stuff and the Motorola Assembler.

What am i doing wrong ?
I would be greatful for some hints! Do you have some working sources
and would share them with me ?

Thanks!
yours Christof 15.Oct.95

:Dangling / non-initialized pointers sometimes produce hard to find
:errors. Initializing all the pointers to zero will point out the
:latter ones...

a mistake I often make: declare a pointer to a structure, and then
forgetting to allocate memory for the structure itself.
difficult to debug, because *reading* a value in the structure
seems to work, while writing to the structure often results in 2 bombs.
or vice versa (depends on your compiler/system).

It's possible that malloc(0) will return a pointer to the start of free RAM without allocating the space. It's known that Malloc(0L) will do that for early versions of TOS.

I have my own memory management system which I developed for ELFBACK (which can allocate thousands of blocks and up to 32 Meg RAM). It also can allocate front-to-back and back-to-front at the same time to cut down on fragmentation. I could send you a copy (Pure C source).

P.S. Are you using RAMLEAK to check for RAM leakage? If not, you should.

Would someone mind posting a C snippet which demonstrates the Line A filled polygon routine? The Atari Compendium isn't exactly as helpful here as it is elsewhere.

Hmm...

Now why didn't I think of that? Too highly skilled - probably :)

Phil.

~ You are genuinely happy, if you don't know why.

Thanks.

Try Hensa (micros.hensa.ac.uk) in micros/atari/tos/q/q135 (I
think!)

Phil.

I have problems connecting an Iomega Zip drive to my atari TT. I think the
problem is, that the Zip drive only can use SCSI address 5 or 6. The atari
hard disk driver only seeks for address 0 to 3. With general SCSI programs
